### PosterJet Server Installation Guide

1. Open the PosterJet Installation DVD or unzip the downloaded archive file(s) containing the PosterJet installation onto the hard drive of your PCs (preferably into the directory C:\Temp).

Browse to the folder „Server Setup“ and open the folder suitable for the operating system you are using, either for Windows 32Bit or 64Bit. Click with the right mouse button onto the file Setup.exe and select the option „Run as Administrator“ from the context menu.

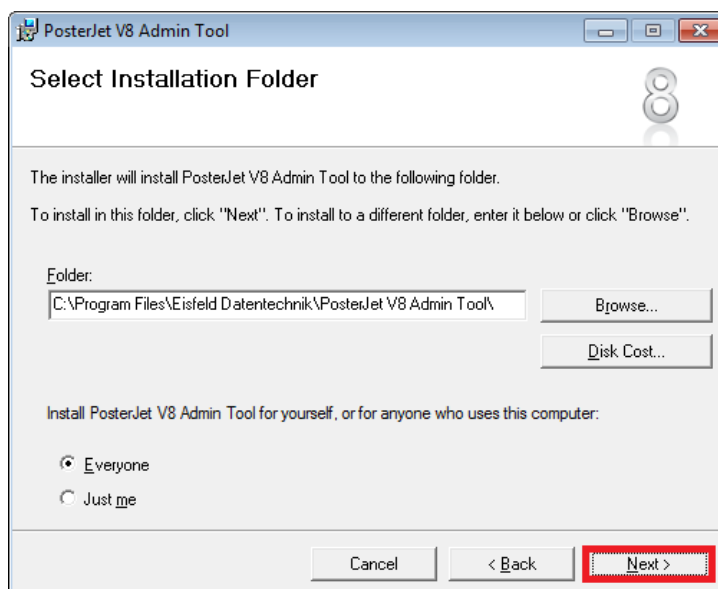

2. The setup is started while necessary Microsoft libraries may be installed first. Continue by clicking the „Next“ button.

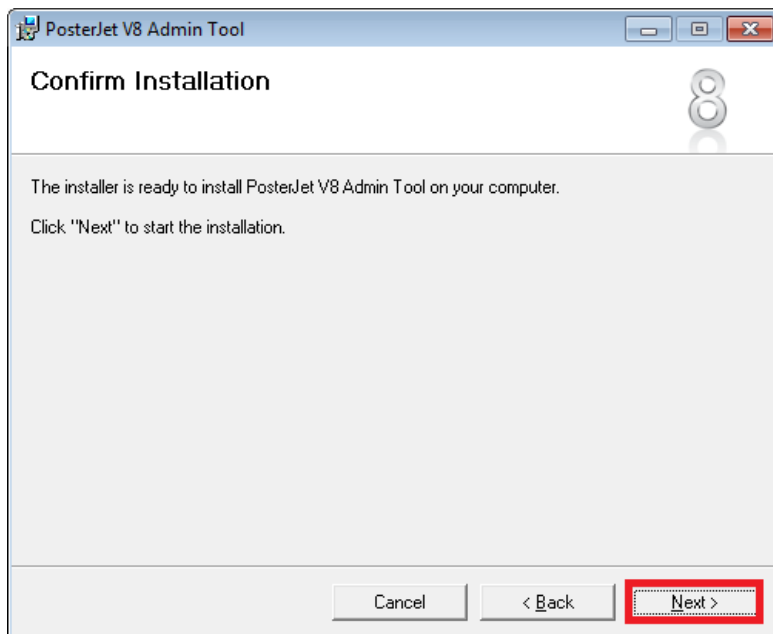

- Carefully read the License Agreement and confirm that you wish to continue with the installation by selecting the option „I Agree“. Otherwise, if you don't agree, please abort the installation by selecting the option „I Do Not Agree“. Click “Next” to continue.

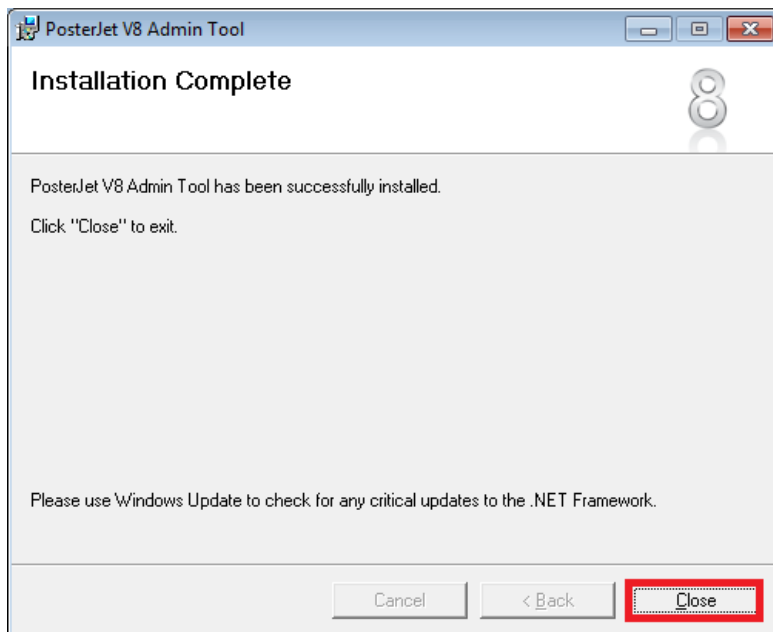

- In case you have decided to continue the following window will appear. Here you can change the installation directory, if needed (e.g. limited hard drive space on drive C). Also select, if the PosterJet Server will later be available for all users that are logged in to your PC (option “Everyone”) or just by you (option “just me”). Continue with “Next”.

- Now confirm that you wish to proceed with the installation of the PosterJet V8 Admin Tool by clicking the „Next“ button (see screenshot on next page).

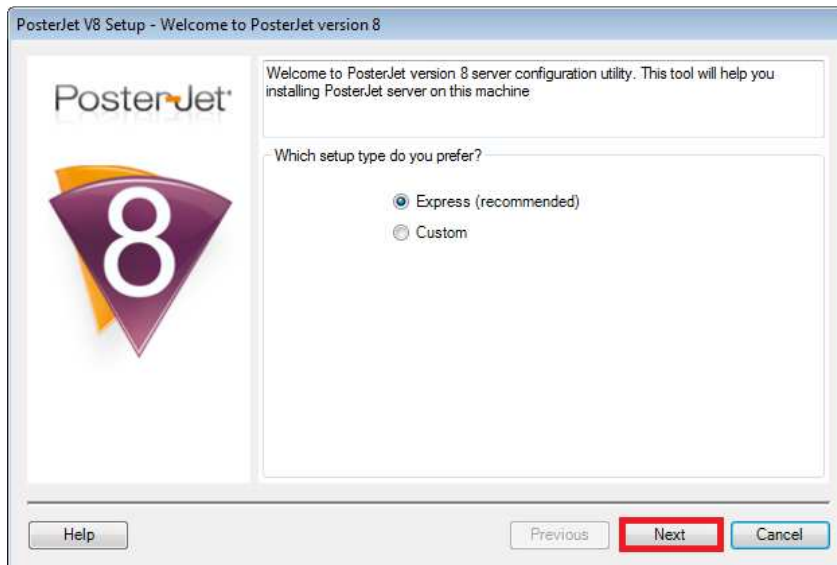

6. After successful completion please click the „Close“ button to terminate part 1 of the PosterJet V8 Admin Tool installation.

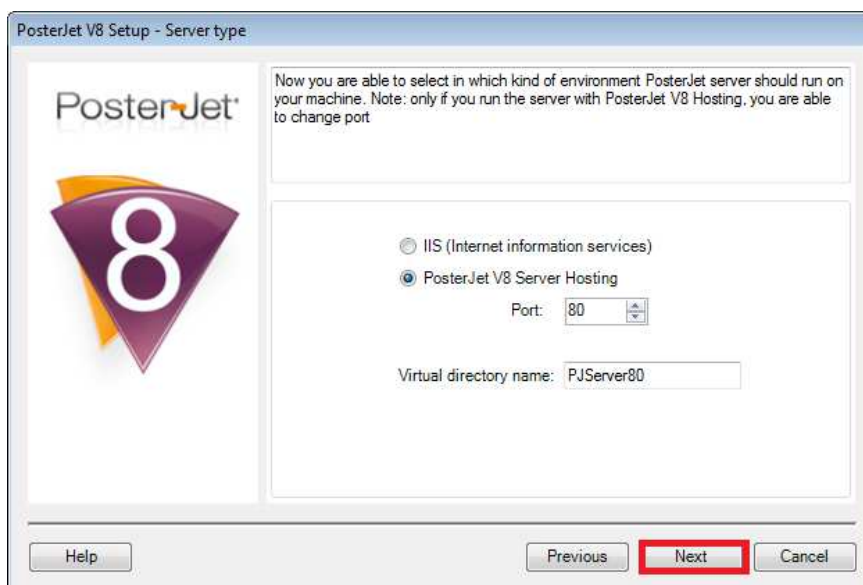

7. The PosterJet Server Installer will now open automatically and will guide you through the installation of the actual PosterJet Server. Please choose between „Express“ and „Custom“ installation. The Express method automatically installs the server with a set of pre-defined parameters, while the „Custom“ setup lets you modify these parameters before the installation. Continue with „Next“ to proceed (see screenshot on next page).

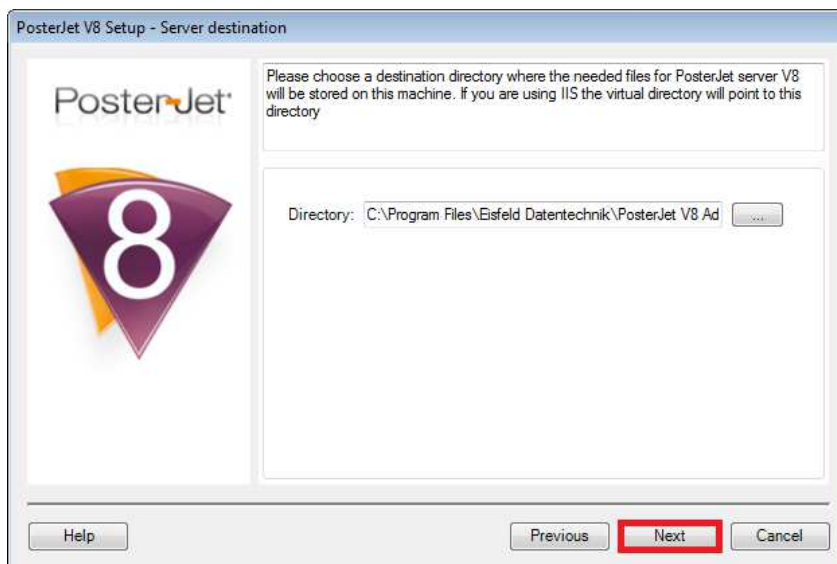

Hint: in case you did choose the Express installation, please continue with Step number 14.

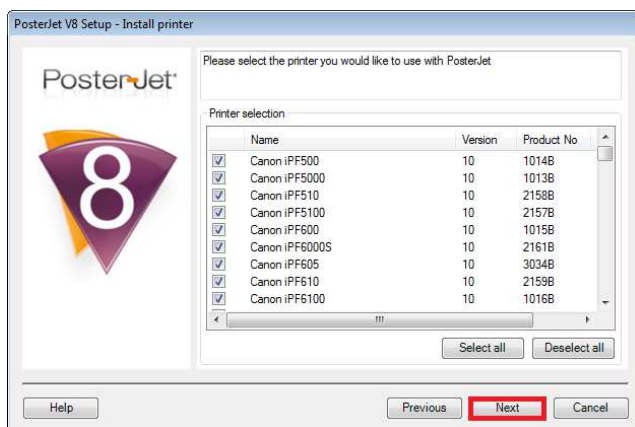

8. In case you did select the Custom installation you can now choose if the PosterJet Server will be hosted by the PosterJet Admin Tool or Windows IIS. We do recommend that you install the PosterJet Server under the PosterJet V8 Server Hosting. The installation of the PosterJet Servers under Windows IIS is recommended for Windows Server operating systems only (e.g. Windows Server 2012). Hint: changes of the port address while installing the PosterJet Server under the Windows IIS will result in a new IIS port address (port address of IIS is changed – also for other services). Please read the PosterJet Support Guide for further information concerning the installation under Windows IIS. Do not use this option, if you are not familiar with the concept of the Windows IIS or are not an experienced Windows user.

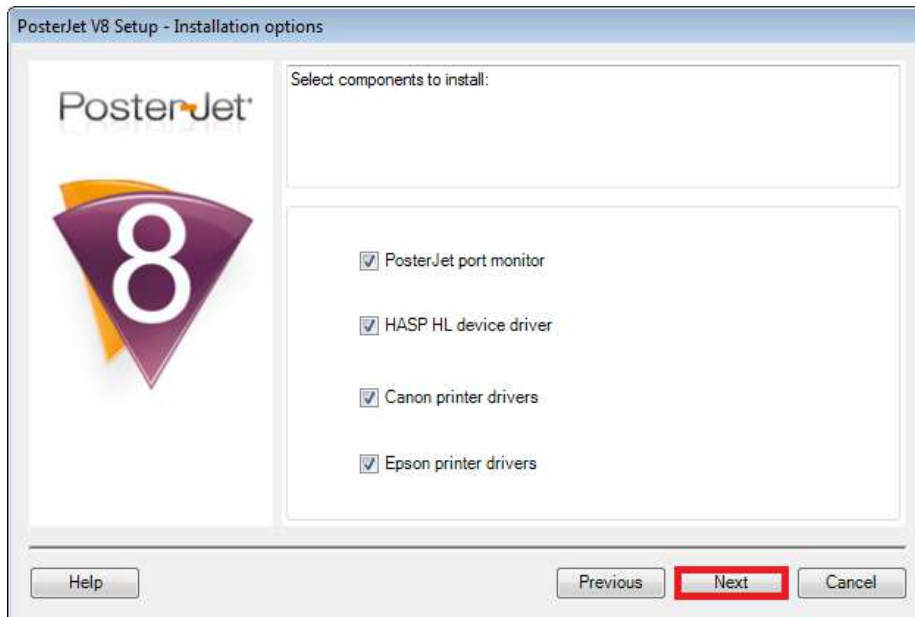

- The following window will show the installation directory for the PosterJet Server (including the folders for the temporary files). Please modify the destination directory only, if you wish to install PosterJet on a different drive than C:\ (in case you there isn't enough free space on hard drive C:\). Click "Next" to continue".

- The next step allows you to change the number of printer plug-ins that you wish to install along with the PosterJet Server. Installing all plug-ins at once takes more to complete the installation. Printer plug-ins can also later be added by using the PosterJet Media Update utility from within the PosterJet Client.

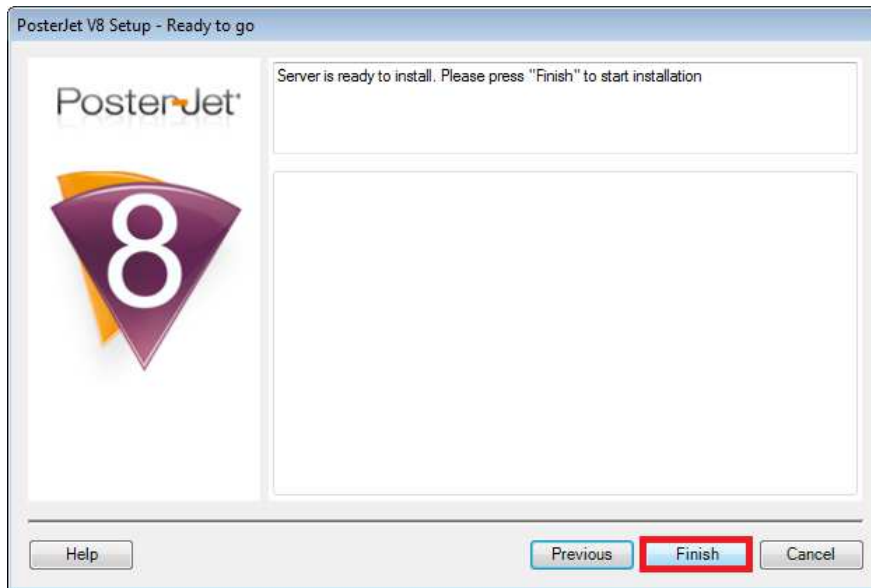

- Continue with „Next“ to install necessary libraries and drivers. We recommend that you use the default options (see screenshot on next page).

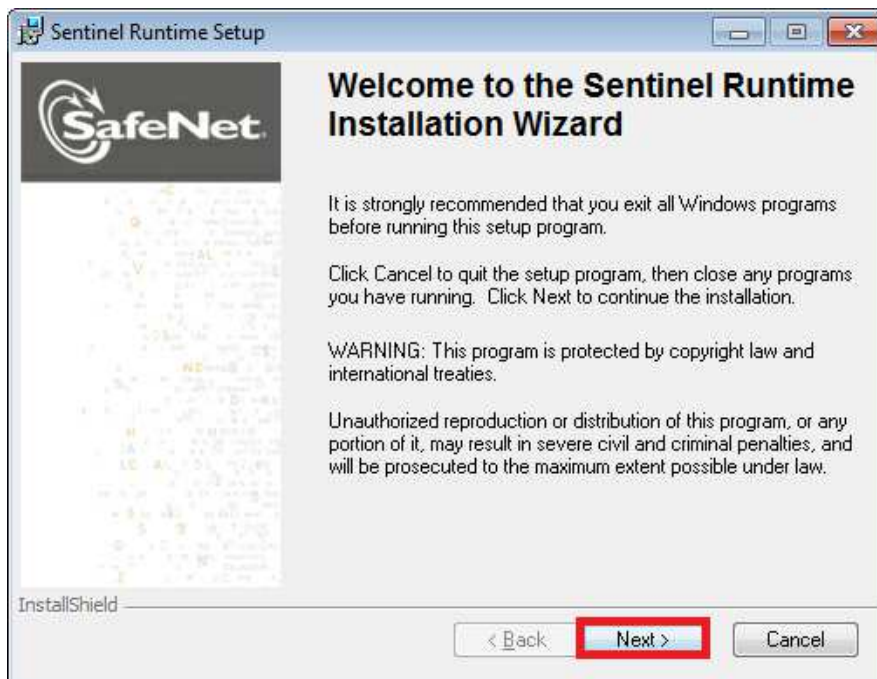

12. You now get the possibility to select a custom certificate for the Client installation when using the Microsoft Click-Once Deployment method. Please do not select any other option than default shouldn't you possess an appropriate certificate file and are familiar with such technology. Please click „Next“ to continue.

13. Now click „Finish“ to start the actual Servers installation (see screenshot on next page).

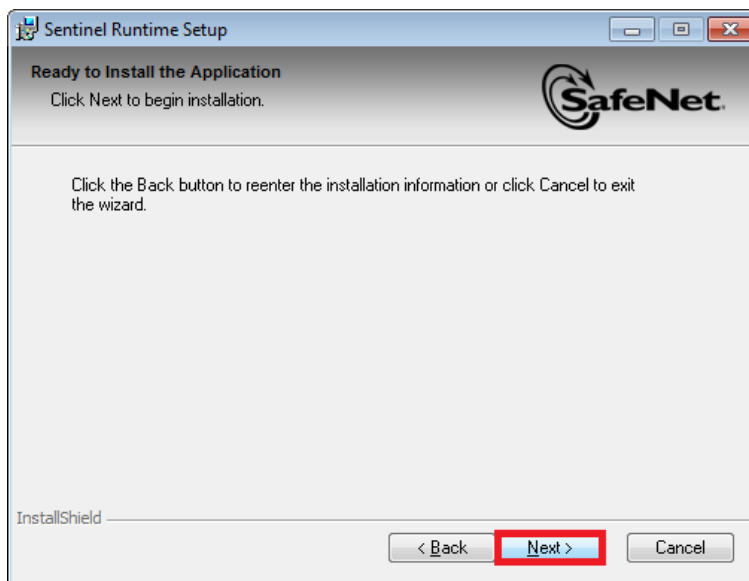

As part of the software installation process, a new driver for the SafeNet HASP USB dongle will be installed if necessary. Please click „Next“ to confirm that you wish to proceed.

14. Now accept the SafeNet license agreement and click „Next“ in order to continue with the installation (see screenshot on next page).

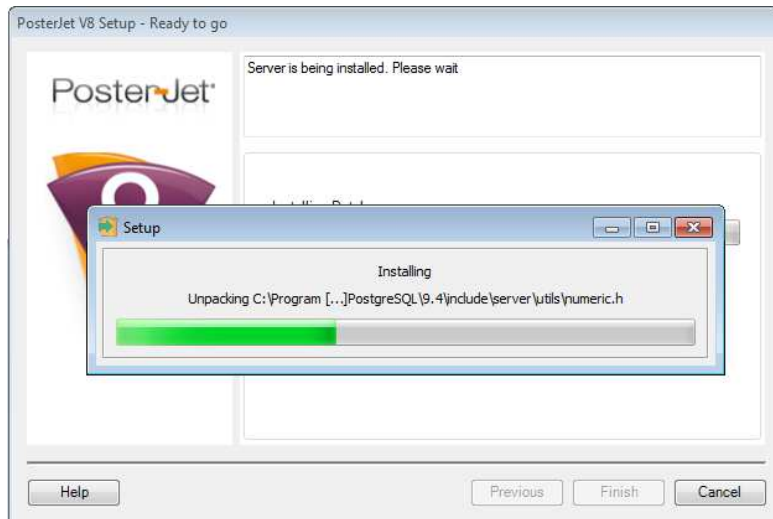

15. Click „Next“ one more time to begin the installation.

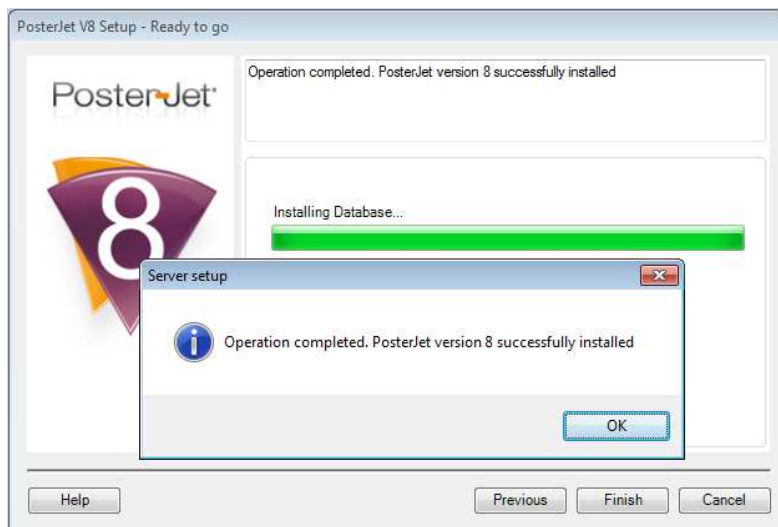

Once the SafeNet has been installed click „Finish“ to proceed with the PosterJet Server installation.

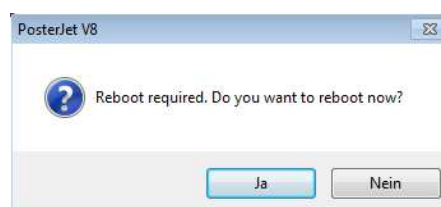

The last components are now installed, among them the PostGreSQL Database for PosterJet (see screenshot on next page).

Please wait until the process is completed and close the window by clicking „OK“.

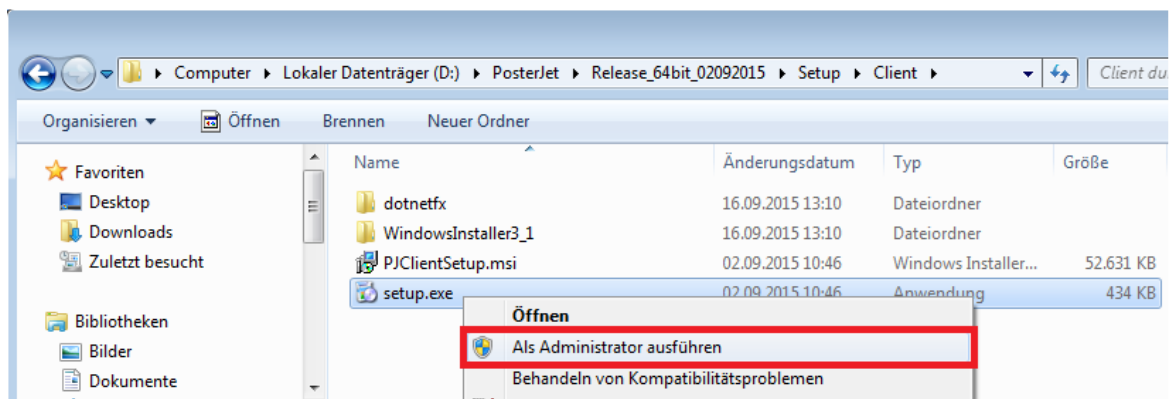

Once all components have been installed you will be asked to reboot the computer. Please confirm that you wish to reboot by clicking on “Yes” (except if you install PosterJet onto a Windows Server operating system and rebooting the system is not an option).

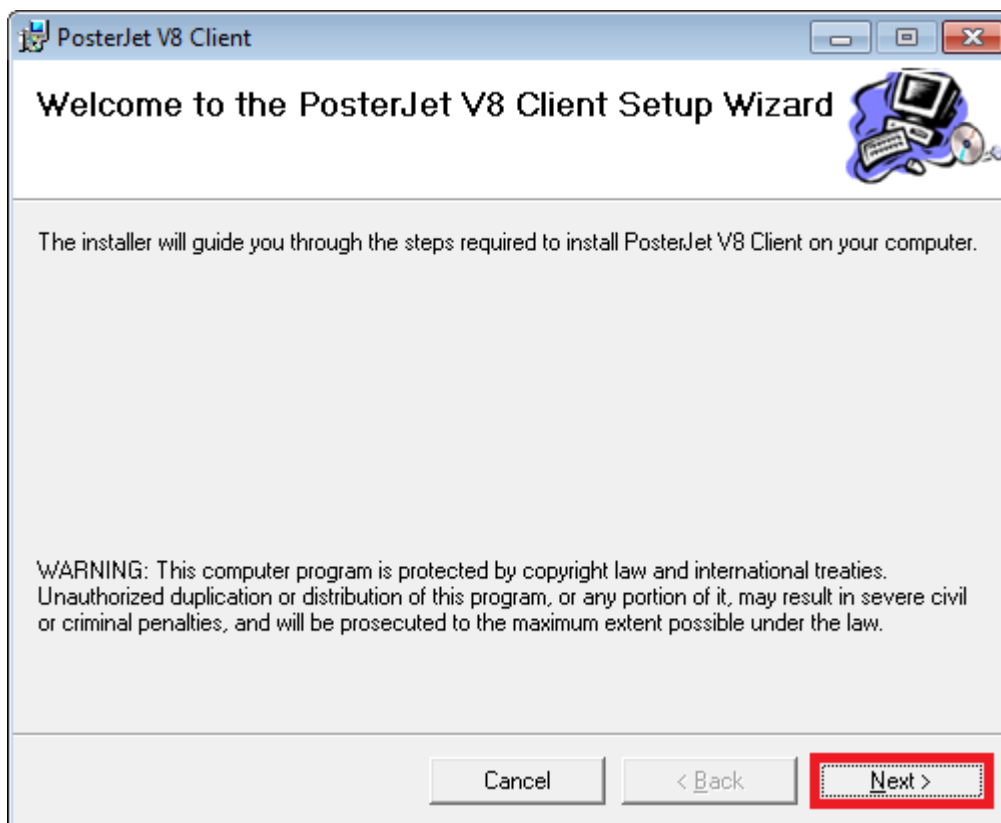

The installation of the PosterJet Servers is now completed. Please proceed by installing the PosterJet Client. Use our Client Installation Guide that can be found on the PosterJet DVD or in the downloaded installation file(s).

### PosterJet Client Installation Guide

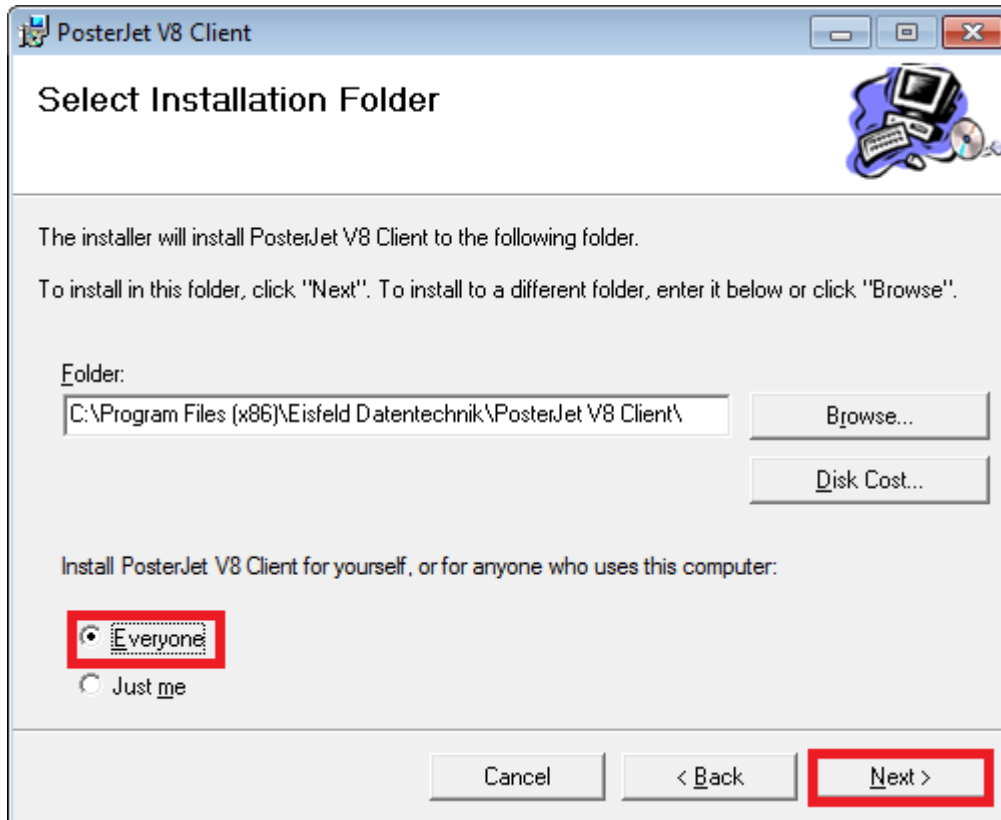

1. Open the PosterJet Installation DVD or unzip the downloaded archive file(s) containing the PosterJet installation onto the hard drive of your PCs (preferably into the directory C:\Temp).
2. Browse to the folder „Client Setup“ and open the folder suitable for the operating system you are using, either for Windows 32Bit or 64Bit. Click with the right mouse button onto the file Setup.exe and select the option „Run as Administrator“ from the context menu.

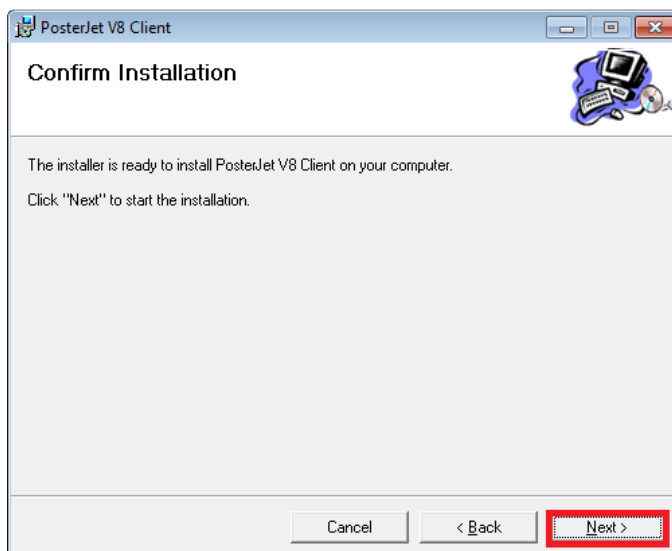

3. The PosterJet Client Setup Wizard appears. Now click „Next“ to continue .

4. Change the installation directory, if required (e.g. limited hard drive space on drive C). Also select, if the PosterJet Client will later be available for all users that are logged in to your PC (option "Everyone") or just by you (option "just me"). Continue with "Next".

5. You are now asked to confirm that you wish to proceed with the installation. Click „Next“ to confirm and proceed.

6. Once the Client has successfully been installed a last window appears. Click „Close“ in order finish the installation. You can now run the PosterJet Client from the Start Menu of your Windows installation.

Please read the PosterJet Support Guide for further information concerning the connection of remote Clients to a PosterJet Server or of local Clients to a PosterJet Server with a different port address.

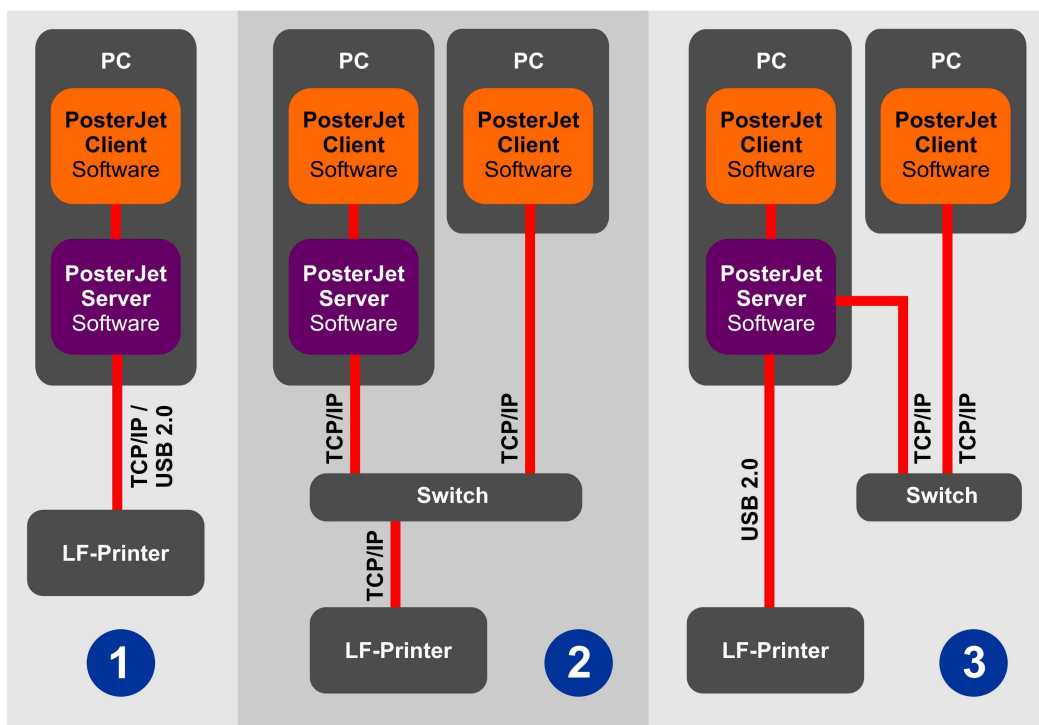

## PosterJet's Client / Server - Architecture

PosterJet is a so called Client / Server Application.

A PosterJet Server is a piece of software that provides the printers connected with printing data. The Server controls all queues (Main print queue, Nest queue) and processes all jobs before printing (Rastering, Scaling, Rotating, etc.). The PosterJet Server is running on one PC and is the administration center of the entire PosterJet printing environment.

A PosterJet Client is the interface of the PosterJet Server and a is the user interface for the operator. Using the PosterJet Client the operator performs all job editing. The Clients provides the operator with information on all queues and messages from the printer. The Client software may be installed on multiple computers. Multiple Client-PCs may be connected at a time via TCP/IP to the PosterJet Server.

## Some possible PosterJet printing environments

1

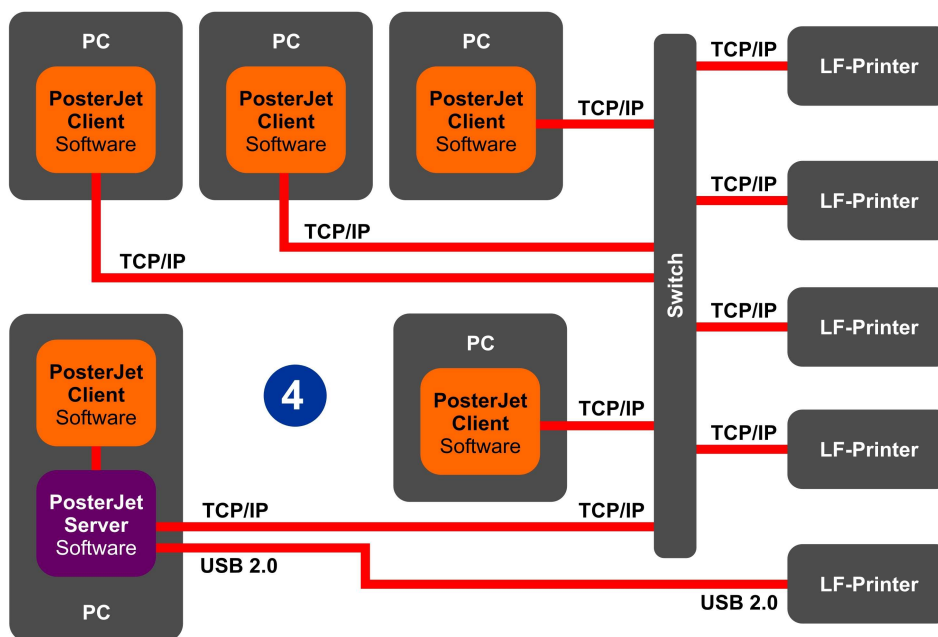

Minimal configuration. PosterJet Server and a PosterJet Client are installed on the same computer. The printer is connected to the computer via TCP/IP crosslink or USB 2.0 (depends on printer)

2

PosterJet Server and a PosterJet Client are installed on the same computer. The printer is connected to the computer via TCP/IP. Another Client is installed on another PC. A TCP/IP switch is required.

3

PosterJet Server and a PosterJet Client are installed on the same computer. The printer is connected to the computer via USB. Another Client is installed on another PC. A TCP/IP switch is recommended.

## 4

Complex setup with one PosterJet Server. PosterJet Server and a PosterJet Client are installed on the same computer. Additional Client is are installed on additional PCs. Four printers are connected via TCP/IP with the PosterJet Server PC. One printer is connected to the PosterJet Server PC via USB. A TCP/IP switch is required. A Gigabit switch is recommended. The computer that hosts the PosterJet Server at minimum a 3 GHz CPU and 4 GB of RAM is recommended.

**IMPORTANT:**

*It is not necessary to run PosterJet on a Server Operating System!*

## PosterJet 8.7 Update or Upgrade

Before updating a previous PosterJet release to version 8.7 it is important to check the current version number:

- Any PosterJet version 6.x or previous: cannot be updated to version 8.7. A new copy of PosterJet needs to be purchased.
- PosterJet version 7 and above: can be updated via internet and email. See procedure below.

**How can the version number be checked?** The easiest way is to write an email to our support team with your / the customer's dongle number. Once we have identified the version number we will reply by email. Please use the following email address to request information on the dongle version: [info@posterjet.de](mailto:info@posterjet.de)

**How can I identify if the dongle needs to be replaced?** Over the years the dongle technology has changed a few times. Only green HASP HL or black HASP TIME dongles can be updated for version 8. They look like this:

Hasp HL Dongle (short and green) that can be updated (only used in version 7 and above). Number of dongle is usually engraved on the front.

Hasp HL Time Dongle (black) can be updated (only used in version 8 and above).

**All the following dongles cannot be updated and must be replaced:**

Older Hasp parallel key (white or red). Update not possible.

Older Rainbow USB key (purple - used in version 5 and 6).  
Update not possible.

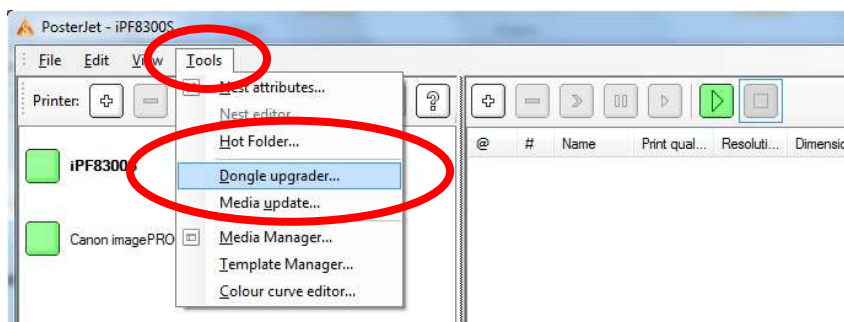

Older Hasp 4 USB key (dark purple used in version 6).  
Update not possible.

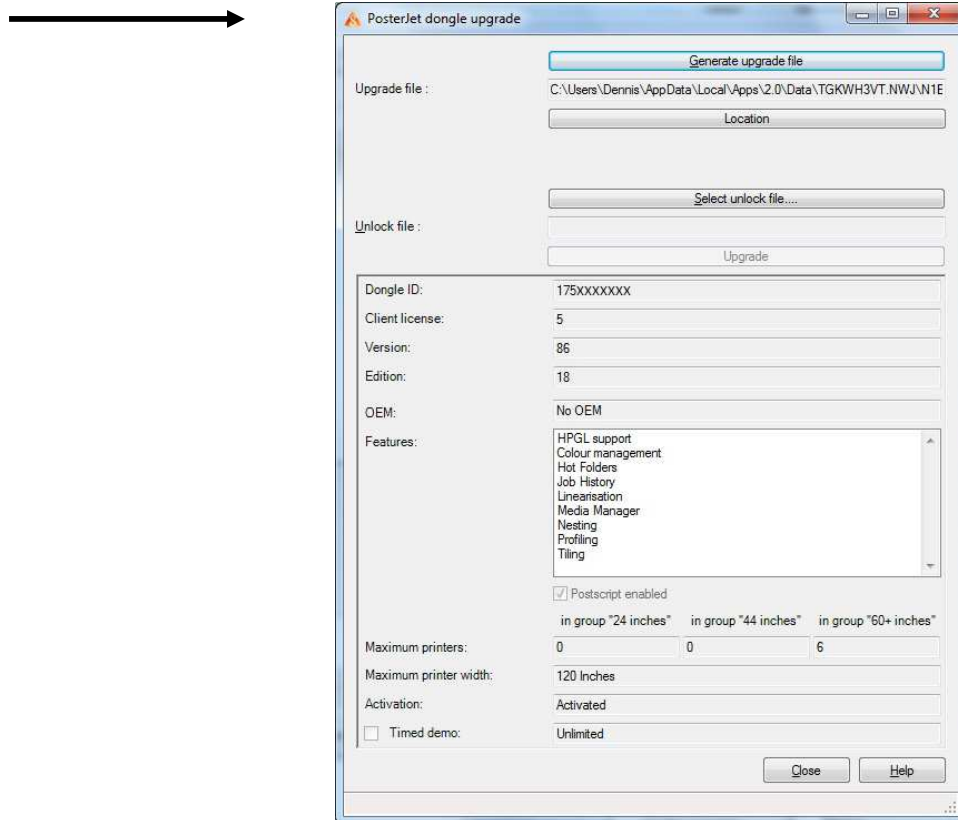

## 1) How to update a PosterJet version 7.X to version 8.7?

- A) You / your customer have gotten an old dongle. You need to purchase a new dongle and send the old one back. There is no other way of updating PosterJet with any older dongle to version 8.7.
- B) You / your customer have gotten a newer green HASP HL dongle that can be updated.

First, you / your customer need to install PosterJet 8.7 after you have uninstalled PosterJet 7. Open the “Tools” menu in the Client window of the new version and select “Dongle upgrader...” in order to create a so called “Upgrade file”.

The following window appears:

### Procedure

First click button "Generate upgrade file". This button is used to generate a dongle specific file (so called Upgrade file) that needs to be send via email to [update@posterjet.de](mailto:update@posterjet.de). The directory in which the file will be placed is shown below in the field "Upgrade file" or can automatically be opened by a click on the button "Location". When sending your email make sure you mention what type of update or upgrade you wish to perform and include your purchase order, if applicable.

Once you receive the so called "Unlock file" from Eisfeld click the button "Select unlock file". Select the file with the extension \*.v2c that you received by email and click the button "Upgrade" that will now become visible.

Wait until PosterJet confirms that the update was successful.

## 2) How to upgrade new features or printers to PosterJet version 8.7?

Follow the procedure as described in section 1 B, as it is the same procedure as updating PosterJet from version 7 to 8.7.

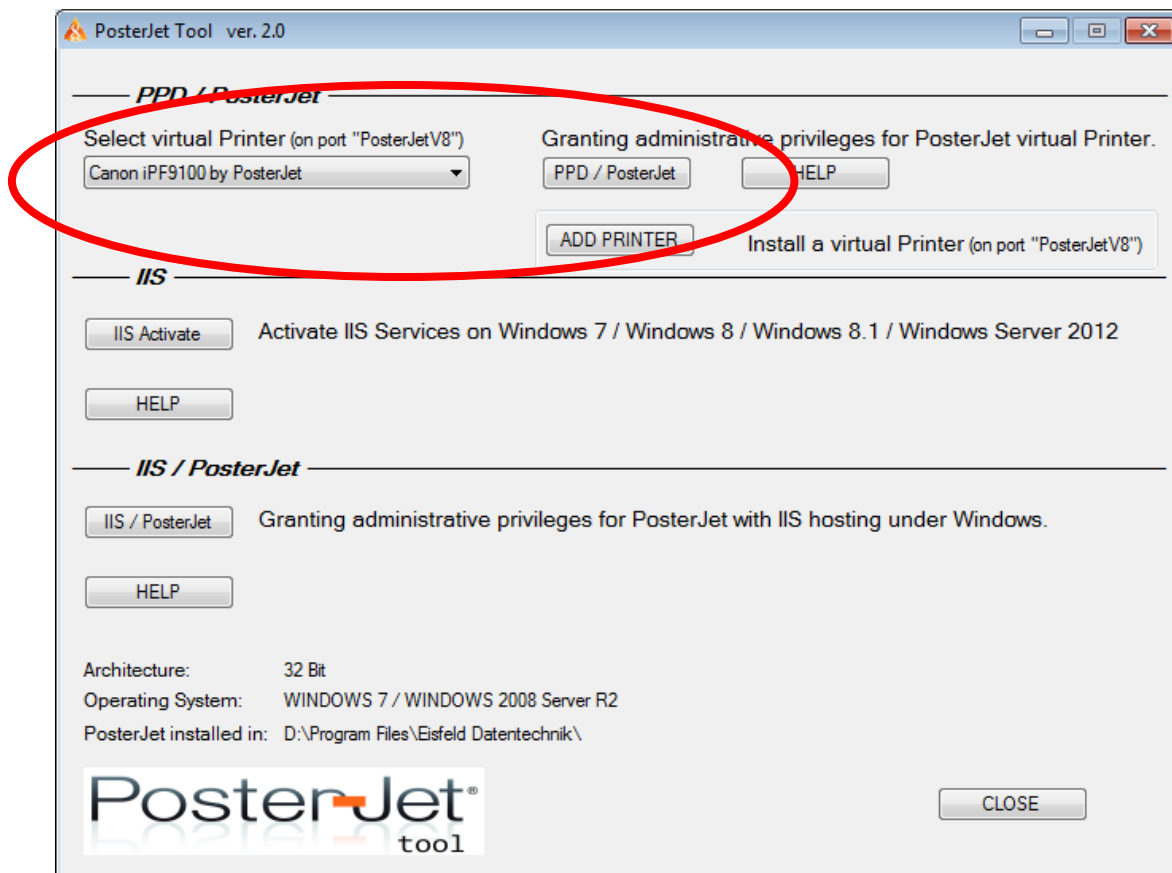

## Install a virtual PosterJet Windows printer driver (short version)

In order to print from any application - like MS Powerpoint or MS Word - directly into PosterJet, a virtual Windows printer has to be installed first. Please follow the instructions in order to install a virtual PosterJet printer under Windows:

1. Go to Windows "Start" and select "Printer and fax devices". Then choose "Add printer".
2. The printer installation opens. Click on "Next" to continue.
3. Choose "local printer" and click "Next" again.
4. Under "Use following port" please choose „PosterJetV8: (Virtual printer port for PosterJet V 8)“, then click on "Next".
5. Click "Have disc" and search for the "PPD" directory on the PosterJet Installation DVD, or locate the PPD folder inside your download folder, if you have downloaded PosterJet from our servers. Select the folder with your operating system and language from within the PPD folder. Then open the respective "PosterJet.inf" file and confirm with "OK".
6. Select your printer model from the list and continue with next.
7. In the next dialogue window you can change the name of your virtual printer, if you like to. Select, if you want it to be the default printer and click "Next".
8. Choose if you wish to share the virtual PosterJet printer in your network. If you choose so, you will have to name the printer for identification in your network. Click "Next".
9. Now you can decide to print a test page or not. Click "Next".
10. The last dialogue window opens. Information on the installation is shown. Click "finish" to complete the installation.
11. Before you can start printing from an application directly into one of the PosterJet queues you must download the file „PosterJet Tool Ver2.exe“ and run it as an administrator in order to set the correct permissions under Windows (otherwise jobs will not be forwarded from the Windows print queue to the PosterJet queue). The toll can be found on our website under:

<http://www.posterjet.com/mehr-downloads/> under „PosterJet PPD und IIS Installer“

Run the tool after you have closed the PosterJet Client and Server. Choose your virtuellen PosterJet printer from the drop down menu under „Select virtual Printer (on port „PosterJetV8“)“. Now click the button „PPD / PosterJet“ and wait the the procedure is completed. It is absolutely necessary that you restart your PC so that the changes become active.

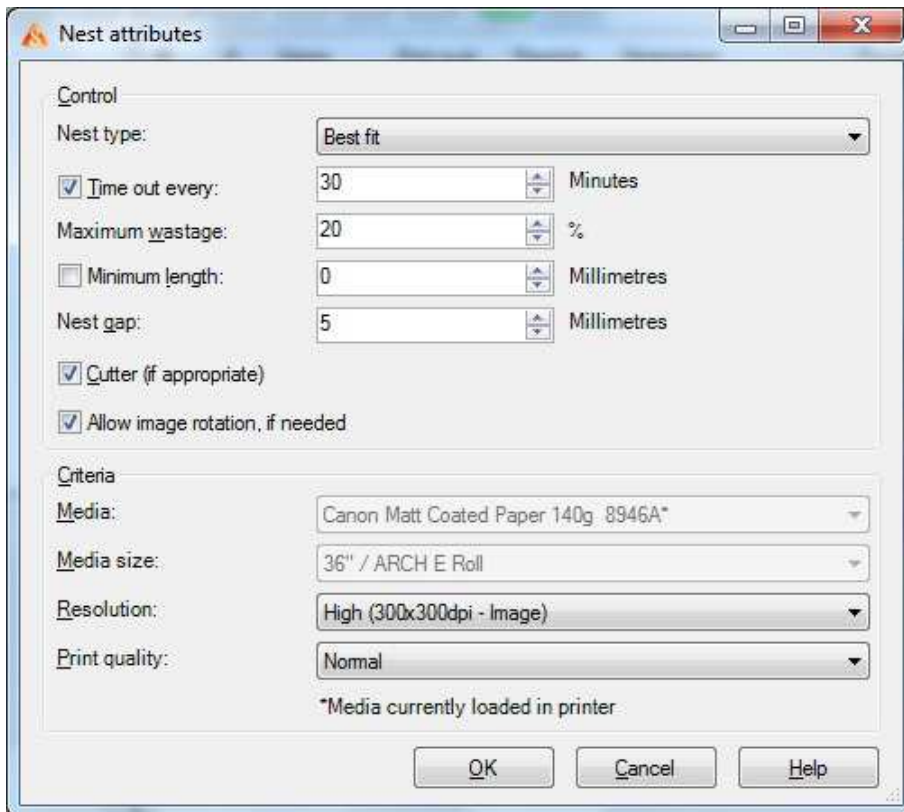

From now on you can print from any Windows (or Mac) application directly into the PosterJet main or nest queue. The virtual PosterJet printer will generate **100% compatible PostScript** data and will forward it directly to PosterJet. There, you can modify or print the file like any other TIF, JPG or PDF file.

Hint: in order to use this functionality, you must have the PostScript module enabled in PosterJet (either buy a PS edition of PosterJet or purchase the PostScript module separately).

## Nesting with PosterJet

The function nesting helps you to print your files on a medium without wasting space. Depending on the settings PosterJet nests the files and even rotates them to fit best. With setting the maculature you avoid the wastage of paper and increase your productivity.

Nest attribute settings:

## Nest Type

### 1. Best fit

The files are nested to use the size of the media to full capacity

### 2. Best cut across

The files are nested for the best possible cut on the X-axis.

### 3. Best cut

The files are nested for the best possible cut on the X- and Y-axis.

## Time out every

Here you can set the time PosterJet waits before sending the nesting job into the main queue. When this box is activated and there are not enough files to nest on the given maximum wastage the files are being send into the main queue after the time out, though.

## Maximum wastage

When the "time out every" box is not activated the files are being automatically send to the main queue when the maximum wastage is falling below the given value and the nesting queue is started. Please note that if the time out box is set to a value and is expired the files are being send to the main queue without minding the maximum wastage.

## Minimum Length

Here you can set a minimal length, which defines when the files are being sent to the main queue when this value is reached. E.g. if you give a length of 30", the files are being send to the main queue, when they reach the length of 30" through nesting.

## Nest gap

Here you can set a gap between the single files of a nesting job.

## Cutter (if appropriate)

Here you can set the cutter, if the medium allows to be cut. Now the cutter is used after this nesting job.

## Allow image rotation, if needed

If this box is activated PosterJet automatically rotates the files to assure that less space is wasted.

## Criteria

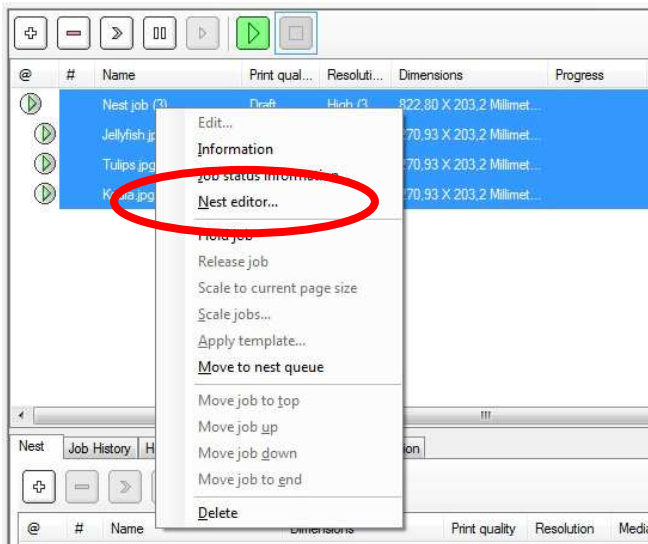

These boxes show you which medium is used, which size the roll/page has, which resolution and print quality have been chosen.

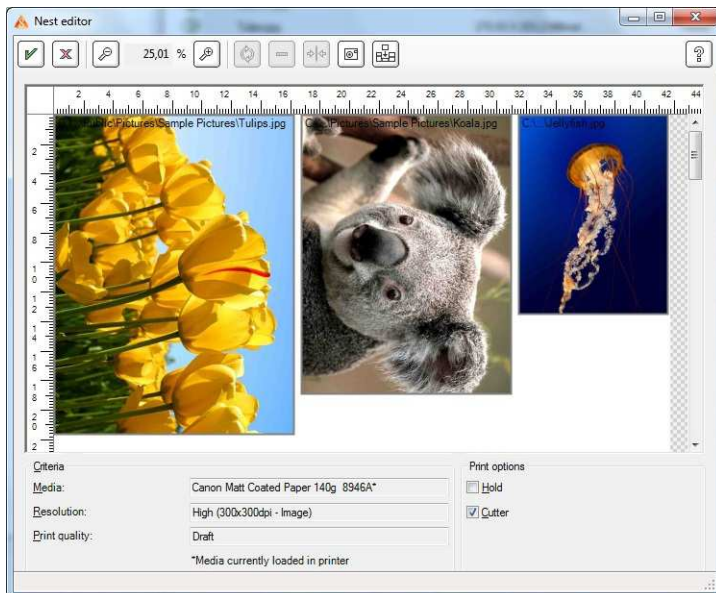

Image: sample nest job

PosterJet 8 comes with a powerful nest preview and editor which allows the viewing and modification of nested jobs before printing. In this preview and editing tool jobs can be previewed, moved, rotated, deleted or centered just before they will be printed.

The nest preview (editor) is activated by a right mouse click on the nest job. Select the option "Nest editor..." from the context menu.

This option is also available for jobs with multiple copies in layout mode.

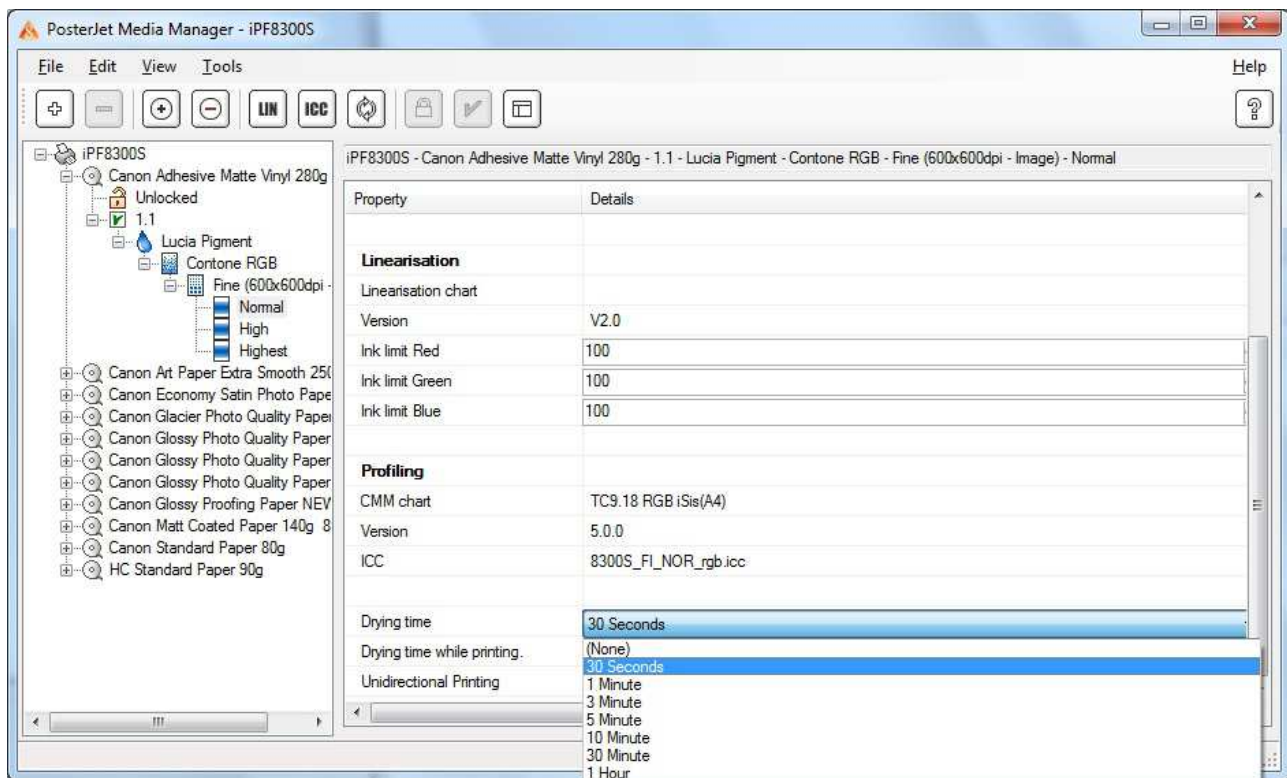

Hint: files that are moved in their position will snap to invisible magnetic guide lines. If you wish to move the files freely around the paper area please hold the ALT-key (and keep it down) while moving one or multiple files.

### Setting a drying time

Sometimes it's needed to set a drying time to e.g. protect your prints from damage. This prevents the cutting from a new printed canvas directly after printing. The print can dry during the drying time before the medium is cut. The damage of the wet print is prevented.

To set the drying time open the “Tools” tab in PosterJet and navigate to “Media Manager”. Open the tree of the media you want to set the drying time for (F6 or clicking the “+”) and choose one of the print modes.

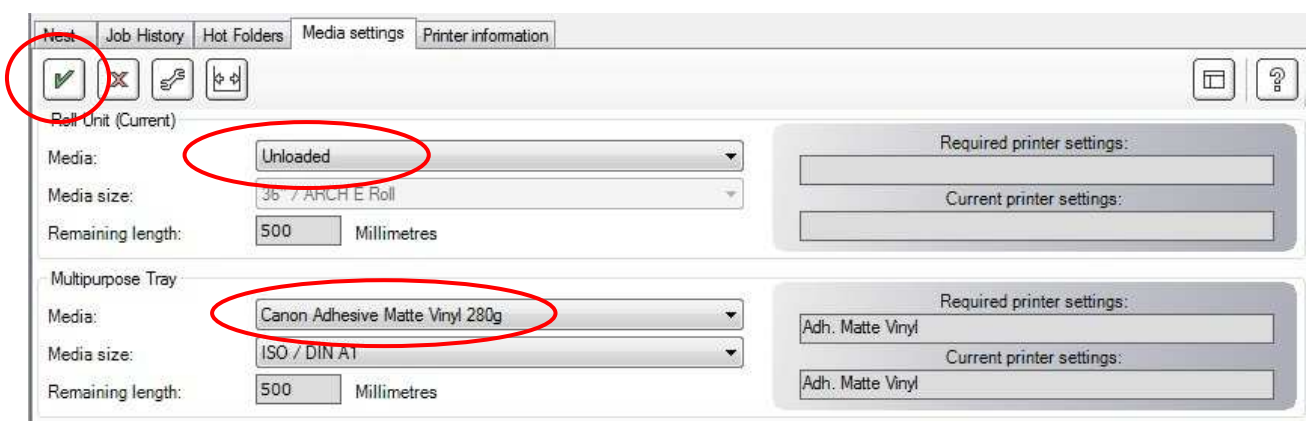

You now can set the drying time under “Drying time”. If you need to slow down the printing process for a specific media you may want to choose the option “Drying time while printing”. Please note that once a drying time is set it is always being used when printing with this print mode on this media.

## Creating ICC profiles for cut sheet media

When trying to create ICC profiles for cut sheets in PosterJet 8, the following problem may occur: in step 6 of PosterJets MediaManager (Print test chart) the test chart is not prepared and set for the media set in the Multi Purpose Tray or Cassette but rather for the media in the Roll selection. This means that the PosterJet MediaManager will place any test chart print job automatically on roll media (changing any previous settings). To still print the test chart on a cut sheet, please follow these instructions:

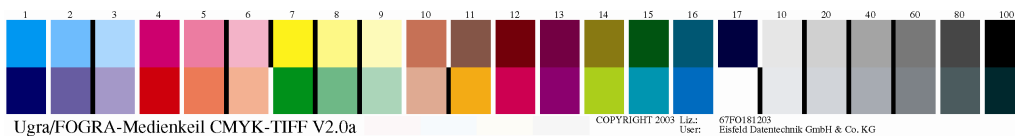

1. Print your test chart as usual with the PosterJet Assistant, but make sure, the main queue is stopped before launching the job.
2. Switch to the „Media Settings“ tab of the PosterJet main window (in the background) and select the media you wish to profile under Cassette or Multi-Purpose Tray. Confirm your selection by a click on the button with the green tick. Best, if you select „Unloaded“ in the Roll Unit section before.
3. Now select the test chart job in the main queue with one left mouse click. Click onto the job with the right mouse button and select the option „Scale to current page size“ from the drop down menu.
4. The test chart has now been placed on your cut sheet media. Maybe you wish to control if the job has not been scaled to less than 100%. For this, please open the job and control the size and rotation in the Job Submission window of PosterJet 8.
5. Confirm your settings by a click on the „Submit job“-button (green tick). Once you start the main queue your test chart will be printed to the cut sheet loaded in the printer.

## Proofing with PosterJet 8

Next to photorealistic output and fine art prints PosterJet 8 is capable to create FOGRA compliant proofs on almost any supported printer. For this purpose, ICC input profiles, based on FOGRA data, and settings in the „Colour“ tab of PosterJet 8 are required.

With PosterJet 8 the FOGRA media wedge\* can be printed with different proof settings for various printing scenarios, in order to measure and analyze its data. This is done especially to evaluate the quality of an output profile (the lower the Delta E deviation from the reference value, the better the output profile). On top of this, one can use the media wedge to analyze changes in the print conditions over time.

Before you start, please download the reference profiles from the ECI website for the offset print environments that you would like to simulate:

<http://www.eci.org/doku.php?id=de:downloads>

If you wish to create a proof based on the ISO Standard 12647-2:2004/Amd 1 (FOGRA 39L) please install the „ISOcoated\_v2\_eci.icc“ profile under Windows while the PosterJet server is switched off. First download and unzip the „ECI\_Offset\_2008.ZIP“ file from the ECI website. Select the file „ISOcoated\_v2\_eci.icc“, and click it with the right mouse button. Select the option „Install profile“ from the drop down menu. This procedure can be repeated for all other reference profiles, whether from ECI or not, that you wish to install. By the way: install means that the profiles are automatically copied to the following Windows system directory: C:\Windows\system32\spool\drivers\color\.

Once PosterJet is re-started, it will read all the profiles located in this directory.

All that is left to create proof prints with PosterJet 8 is to make the right settings in the „Colour“ tab of the submission window (see screen shot below).

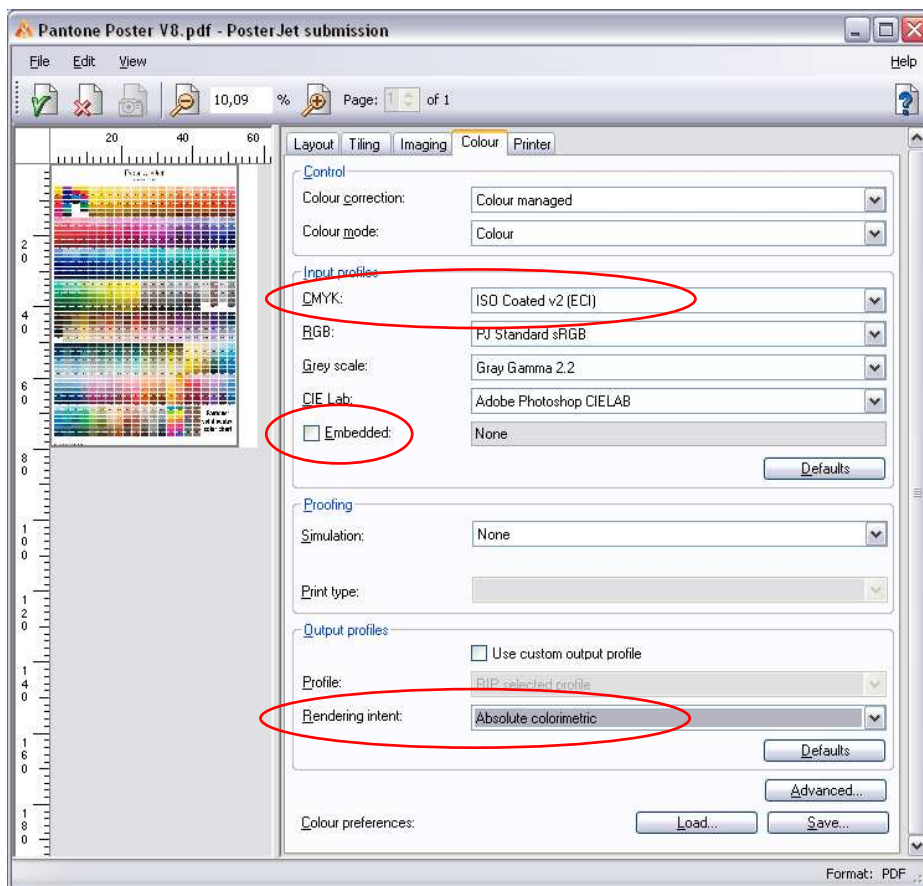

Image: „Colour“ tab of PosterJet submission window

## Particularities:

- When working with RGB output profiles (printer receives RGB Contone data) only RGB simulation profiles can be selected. We from PosterJet recommend RGB Contone for all Canon and Epson printers, as this method guarantees the best results. Anyway, we do not recommend the use of any RGB simulation profile for printing. That makes no sense.
- The above shown settings are only valid, when printing pure CMYK files. Once files are printed with CMYK and RGB data, we recommend to switch to “Advanced...” settings and to set the rendering intent for CMYK (Absolute) and RGB (Perceptual) separately.

The media wedge should be analysed using a suitable tool (not part of PosterJet software).

\* The FOGRA media wedge is not part of PosterJet 8 either and has to be purchased separately.

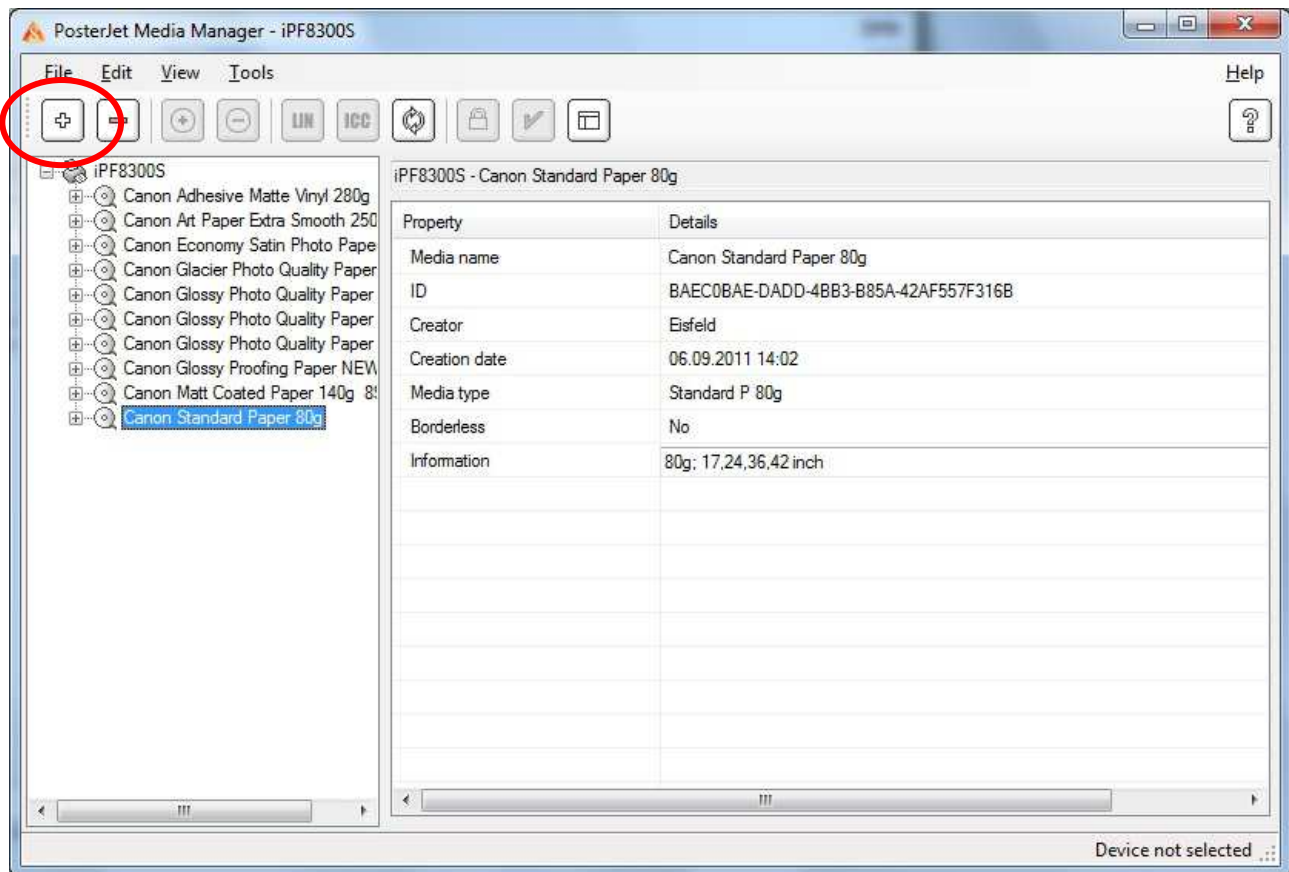

## Creating custom media profiles using PosterJet 8.7

It is easy to create custom media profiles for Canon imagePROGRAF printers using PosterJet 8. To do this the following requirements must be fulfilled:

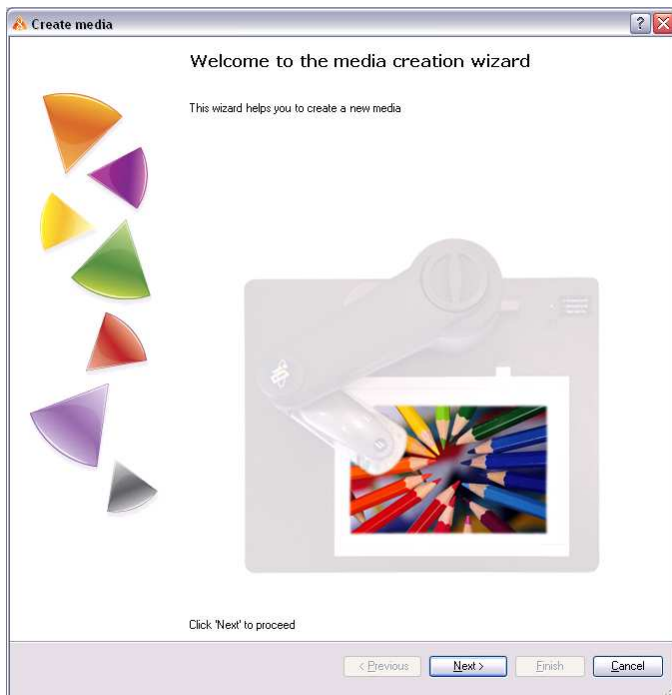

- You own a color measurement device that is supported by PosterJet 8 (Spectral photometer): X-Rite Eye-One Pro, X-Rite Eye-One iO, X-Rite iCColor, X-Rite DTP 70, DTP 45, DTP 20, GretagMacbeth SpectroScan.
- You own the PosterJet profiling module.

Please proceed as follows:

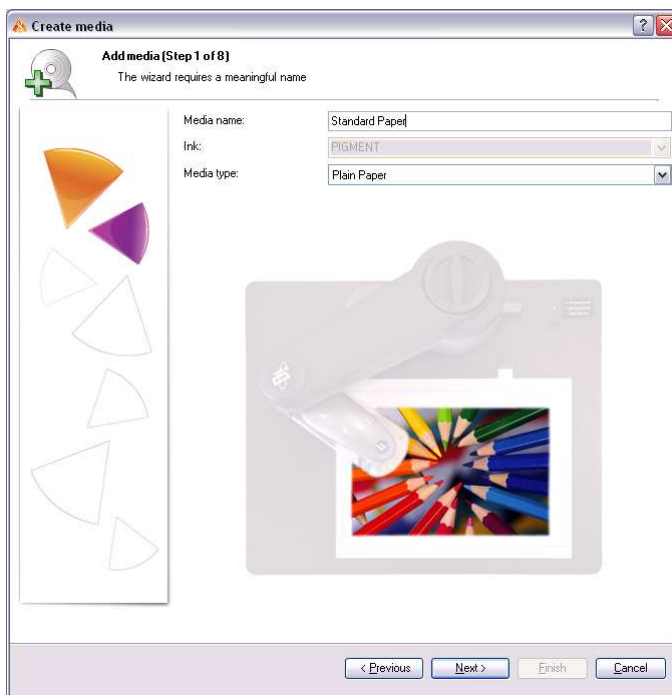

Launch the PosterJet 8 Media Manager (Menu „Tools“ -> „Media Manager...“). Choose the measuring device from the menu „Tools“ -> „Choose measuring device...“. Click the "+" button to create a new media.

The profiling wizard will now be launched.

Click „Next“. Step 1 of 8 of the profiling wizard will be launched.

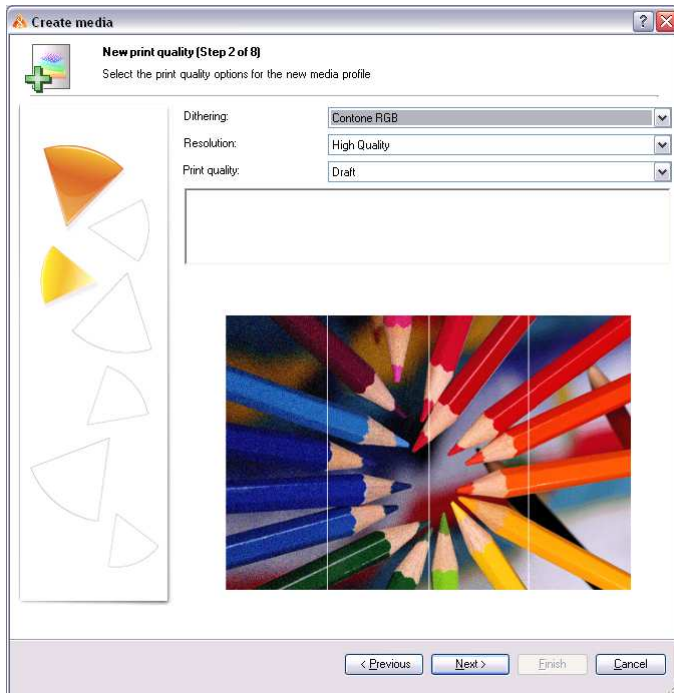

Step 1: Enter a meaningful name into the "Media Name" field. This media name will appear in the PosterJet Media Settings afterwards. It is recommended to incorporate brand and product description (or order number) into the new media name. Select the media type corresponding to the media you would like to profile.

Important: the selection of a dedicated media type indicates the black ink type (Matte black or Photo black), ink limit, and print quality. If you have any questions regarding the proper

media type, please ask the media manufacturer for more information. The Media type selected is also the front panel setting that must be selected in the printer during the loading of the media.

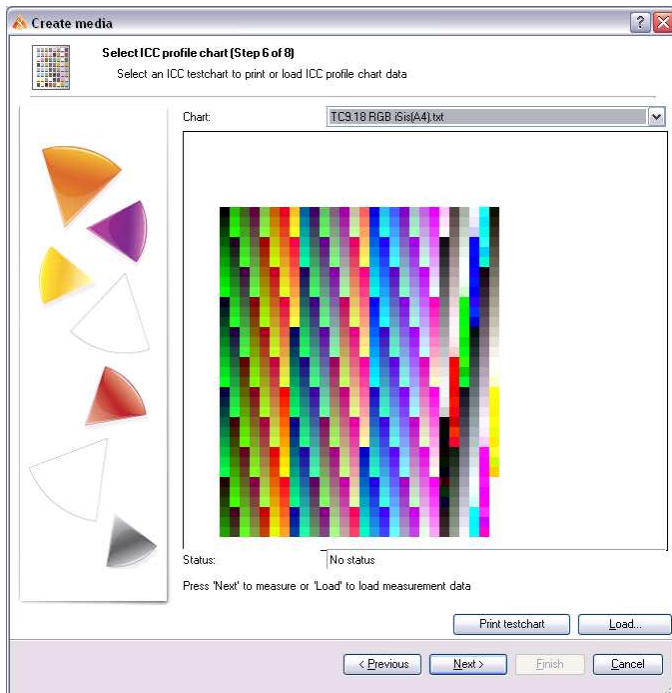

Click the „Next“ button.

Step 2: Print quality selection. A PosterJet media may contain multiple print qualities. For every print quality a dedicated media ICC profile must be created. The complete workflow described in this document must be performed for every single ICC profile (= print mode).

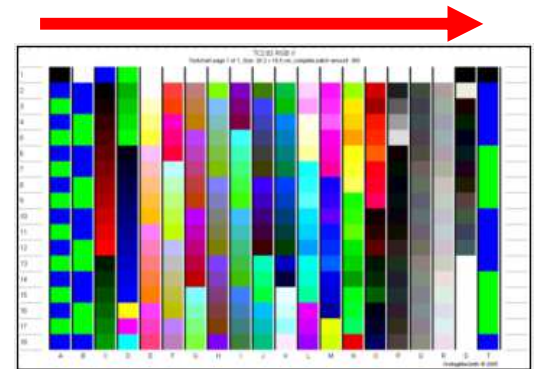

For the Canon iPF printers we highly recommend the Dithering option „Contone RGB“. Choose the desired resolution from the "Resolution" drop down list. From the "Print quality" drop down list choose the desired print quality. The combination of these three parameters represents a PosterJet print quality (a single print mode for a single media).

Complete step 2 by clicking the "Next" button.

### Important note:

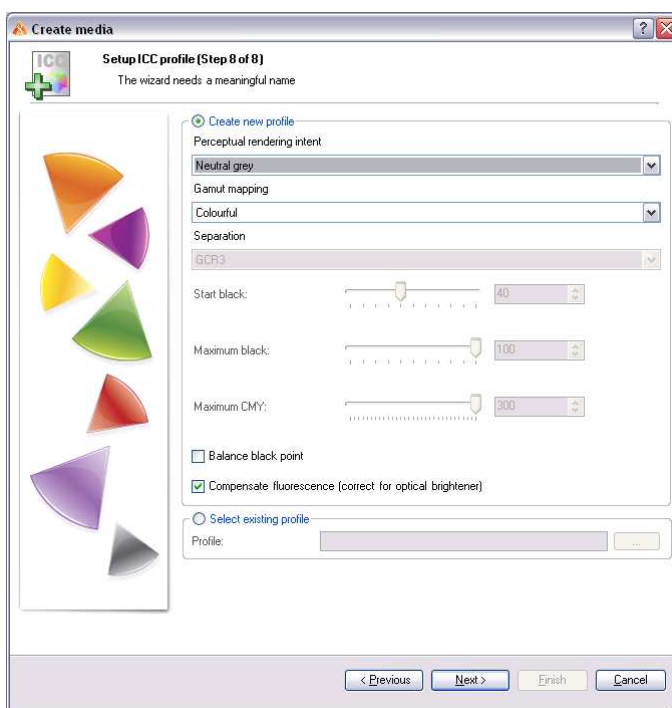

In case you are using an Eye-One measuring device please make sure you are always measuring from left to right and never backwards.

You are now directly guided to step 6: Selecting and printing a test chart.

Select the desired test chart and click on the "Print test chart" button. Depending on the measuring device the printed test chart will look different. To print the test chart please make sure that the main print queue of PosterJet is running and the respective media is loaded into the printer. PosterJet will now print the test chart.

Click the "Next" button. The measuring device will now be calibrated. In step 7 you will be asked to measure the test chart. After measuring the chart click the "Next" button.

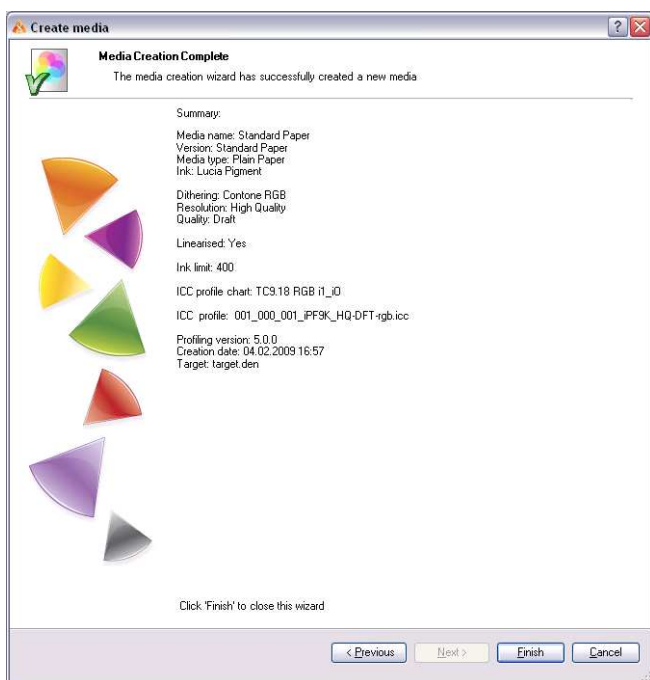

Step 8: Creating the new profile. Only modify the default settings if you are familiar with the options provided. It is recommended not to change the default settings. Click "Next" to create the new profile.

You will be asked to enter a name for the new profile. Otherwise you can accept the proposed profile name by clicking the "OK" button.

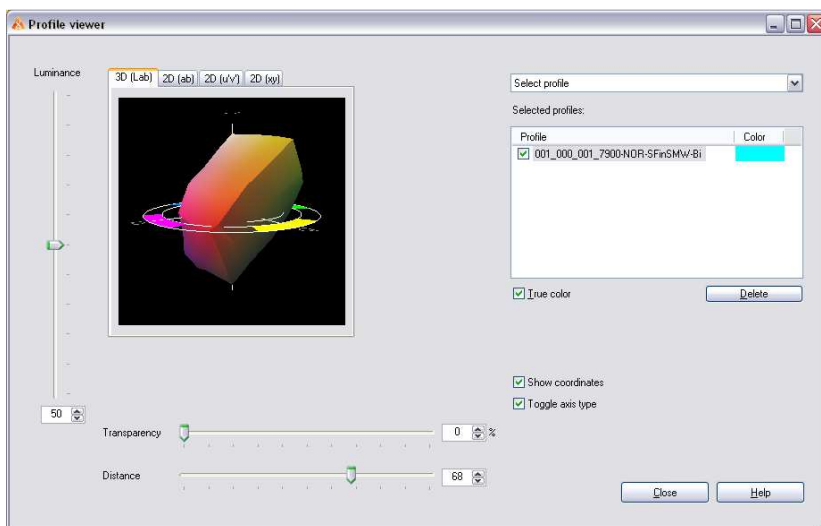

The new profile will now be calculated

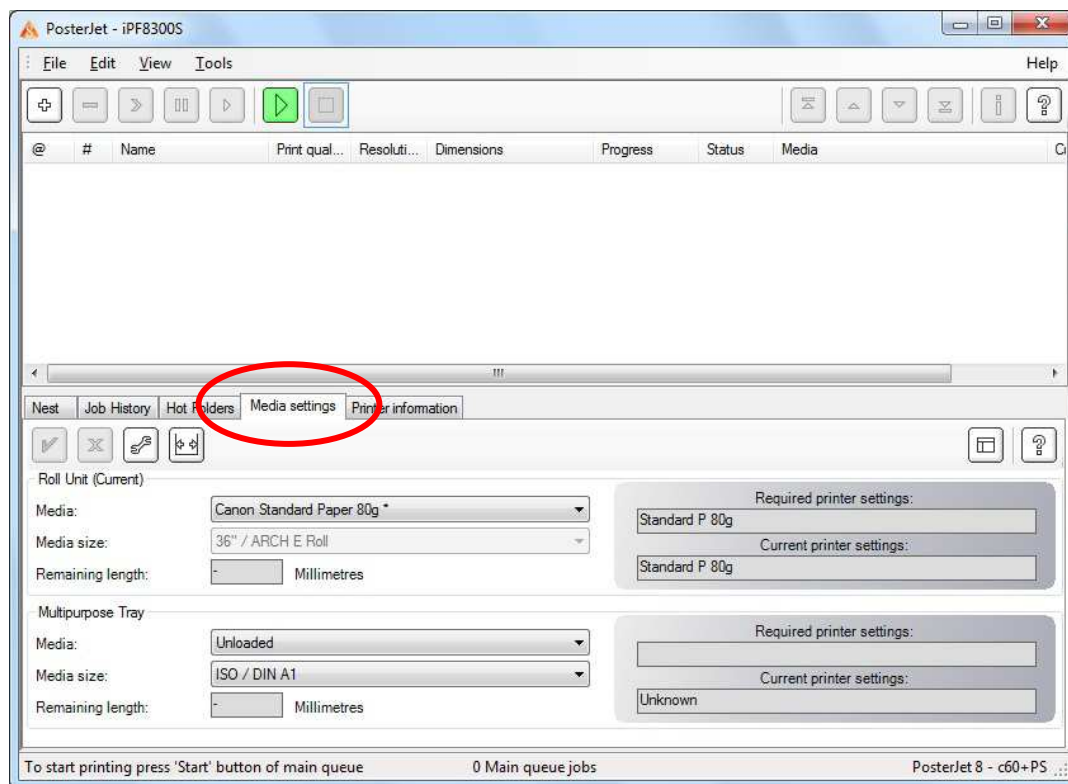

The profile was created successfully and stored on the hard disc. Close the wizard by clicking the "Finish" button.

We recommend you quickly check the new profile for errors. Please click with the right mouse button onto the print mode in MediaManager that you just profiled and select the option 'Profile viewer' from the context menu. Check that the new profile is correct and does not show any errors in the geometry.

The new profile is now available on the PosterJet Media Settings tab.

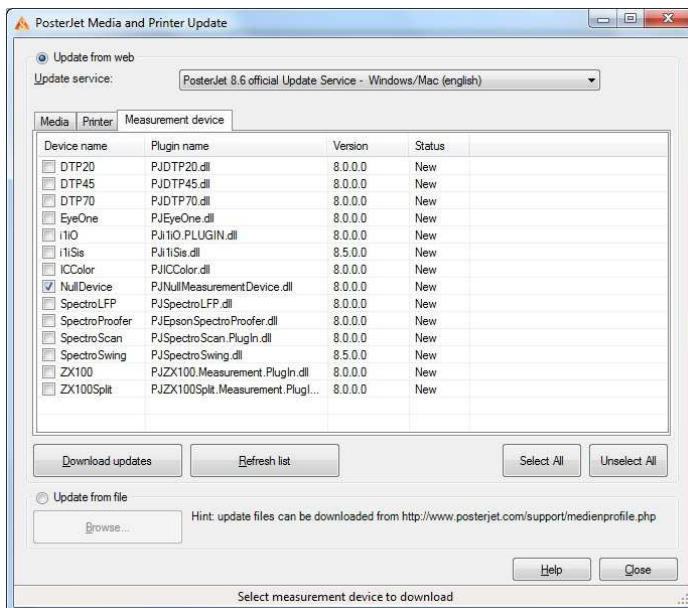

### PosterJet 8 media profile service

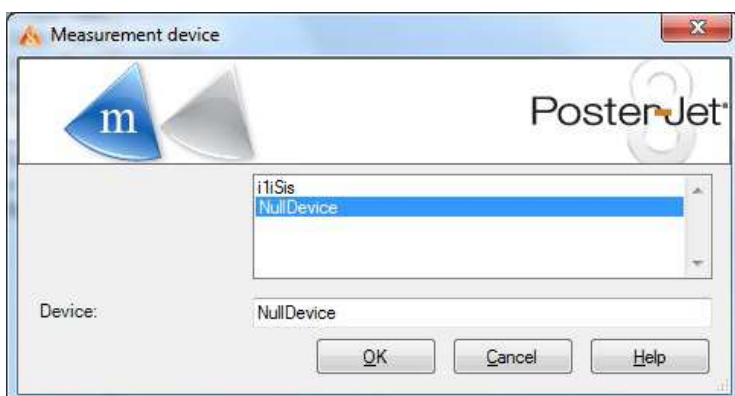

In the case you do not have access to a measuring device and do not own a profiling software but do own the PosterJet Linearization module we are proposing to create the profile for you through our profile creation service. We will charge 120,- € for every media profile with one print mode (one ICC profile).

To order your own media profile proceed as follows:

Launch the PosterJet „Media Update“ from the „Tools“ menu and select the „NullDevice“ measuring device.

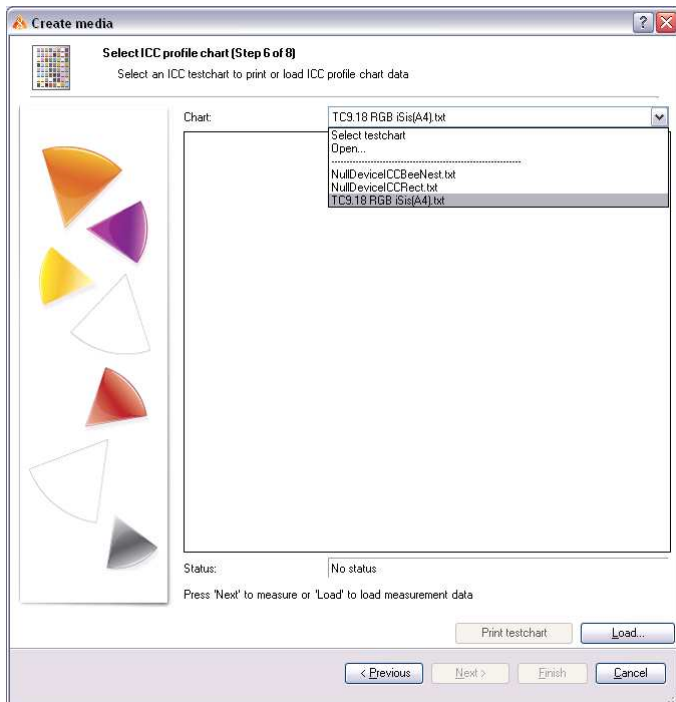

Click on "Download updates". After downloading the file close the update dialog window. Launch the Media Manager from the "Tools" menu of PosterJet and select the option "Select measuring device" from the "Tools" menu.

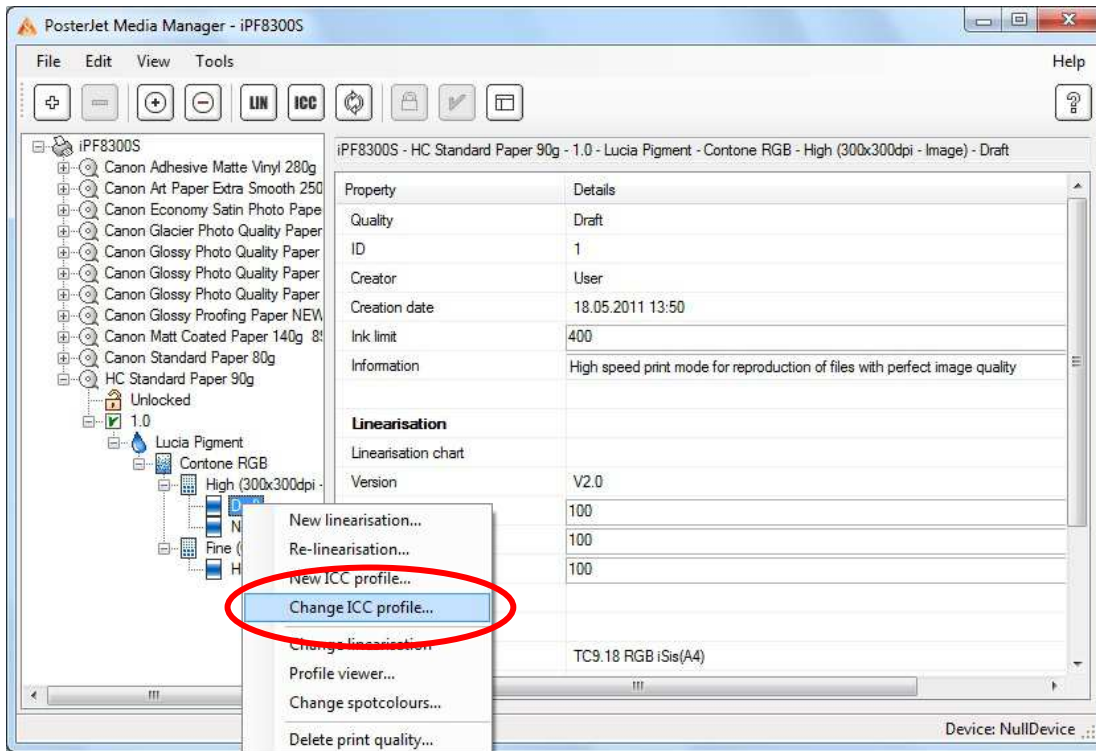

Select NullDevice and click „OK“.

Start the media creation process as described above. Follow the workshop until the test chart selection step. Choose the chart „TC9.18 RGB iSis(A4).tif“.

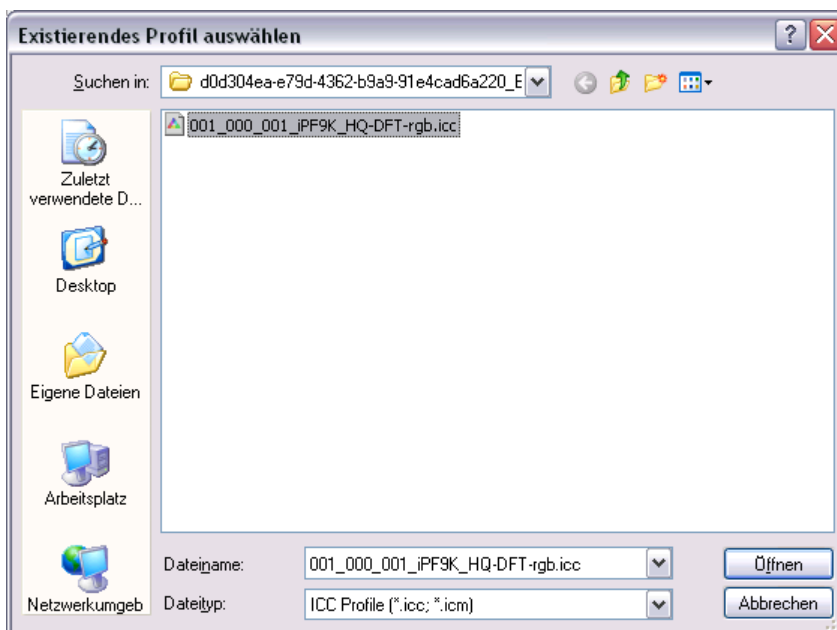

Print the test chart as described above and send us the printed test chart via mail. Please make sure, that the test chart print out is not damaged or folded. The print out should not be exposed to direct sunlight or other UV radiation. Let dry the print out for about an hour before packing it. For transportation please use a tube made out of card board or plastic. Do not fold the printed test chart. Please let us know the media name and the desired print mode for the ICC profile.

You will receive an e-mail containing the ICC profile from us. To integrate the profile into PosterJet launch the Media Manager and press the F6 key to unfold the media tree.

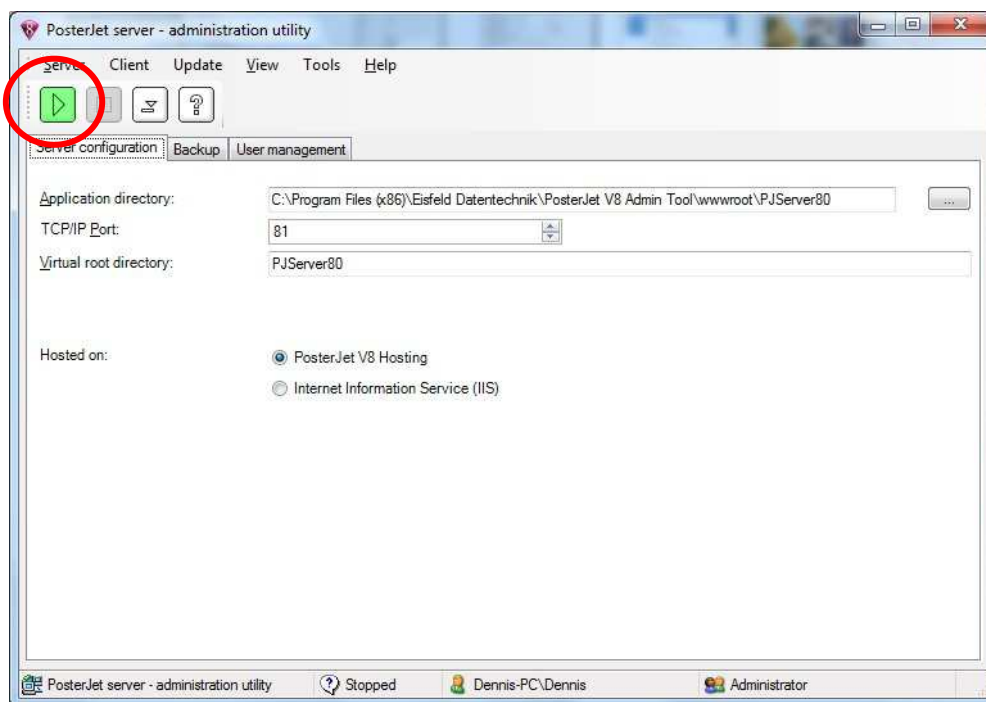

Right-click on the print mode you would like to equip with the new profile and select "Change ICC profile..."

From the file browser dialog window select the new profile you received from us. Click the "Open" button. The new profile will now be implemented into the PosterJet media management and is available for printing via the Media Settings tab of PosterJet.

## PosterJet Server does not start

In rare cases it may happen that the PosterJet Server will not start – even if the TCP/IP Port has been changed or the software has completed been re-installed. The purple Server Icon in the Windows taskbar appears, but the Server isn't starting (Start-button jumps back).

If the start button is visible it means that the PosterJet Servers failed to start correctly.

In this case it is highly probable that the PostgreSQL database software is not running correctly. Please check that the database software is running correctly or reboot the PC.

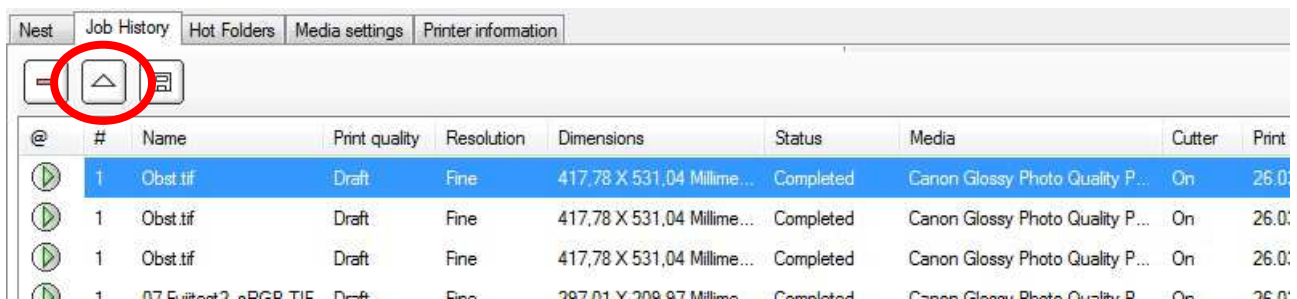

Please contact our support at [support@posterjet.de](mailto:support@posterjet.de) should you still encounter issues with the server start or read Support Guide No. 24 for further instructions.

### Reprinting jobs from the Job History onto a different media

As soon as a job is reprinted from the Job History onto a different media than originally selected the message *'Media not loaded'* will appear. Please check entry under *'media settings'* in the status bar of the main queue. The job has been paused and PosterJet 8 will not reprint it automatically.

Example:

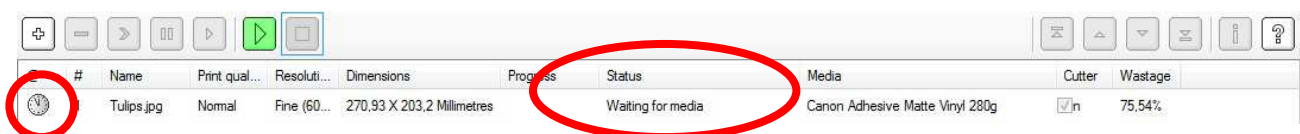

The job 'Winter.jpg' was originally printed onto *'Adhesive Matt Stretch Vinyl 270my'*. With a mouse click on the 'Submit'-button (see red circle) in the Job History the job can be resend to the main queue for reprinting.

If, in the meantime, the media has been changed in the printer and in the PosterJet tab *'Media settings'*, e.g. from *'Adhesive Matt Stretch Vinyl 270my'* to *'Matt Coated Paper 140g'*,

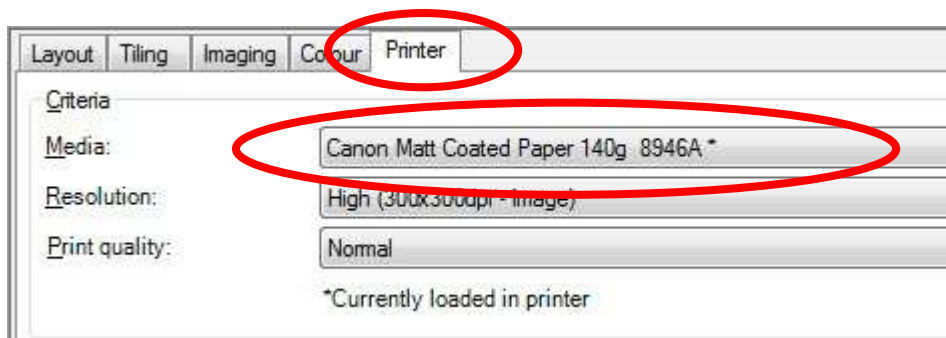

the resubmitted job in the main queue will be paused and the status message changes from *'Ready'* to *'Waiting for media'*.

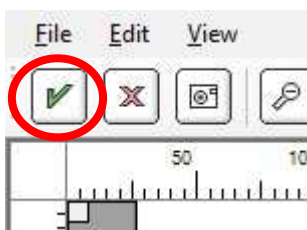

To print the job anyway with the correct settings for *Matt Coated Paper 140g* proceed as follows:

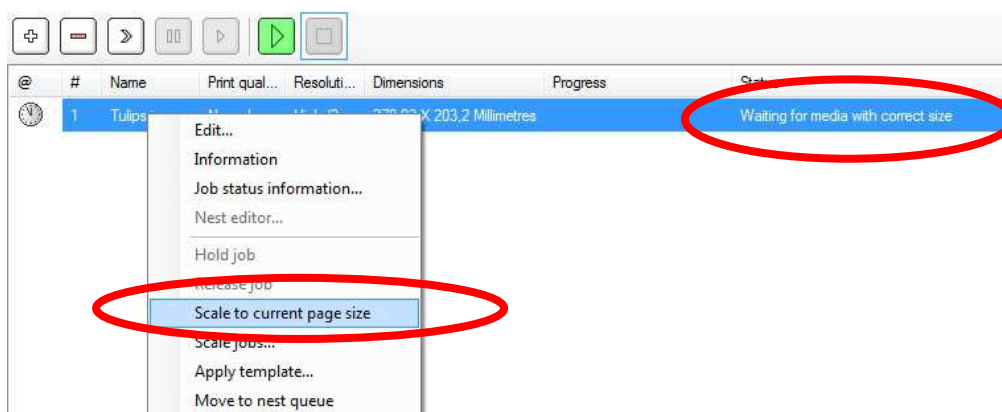

- Double click the resubmitted job in the main queue with the left mouse button to open the PosterJet submission window.
- Change to the tab '**Printer**' and select the currently loaded media from the media list (in this case: *Matt Coated Paper 140g \**). Hint: the currently loaded media is marked by a star.

- The job can now be submitted by clicking onto the green submission button

- Eventually, you will have to adjust the scaling of the job if printed onto a different roll size. Attention: is the new roll (Matt Coated) smaller than the roll that was originally used (Stretch Vinyl) you must confirm manually to rescale the job to the new roll size (job will now be reduced in size!). For this, click with the right mouse button onto the job in the main queue and select the option '*Scale to current page size...*'

- This adjustment affects the size of the job and will adjust it to the current roll size. You may at any time change the size manually by opening the job in the submission window (double click the job entry with left mouse button to open submission window). Before printing always check if the job is at exactly the size needed when performing the *Scale to current page size* option.
- The job is now ready for printing. To start printing just start the main queue by clicking the Start-button.

## Working with PosterJet templates

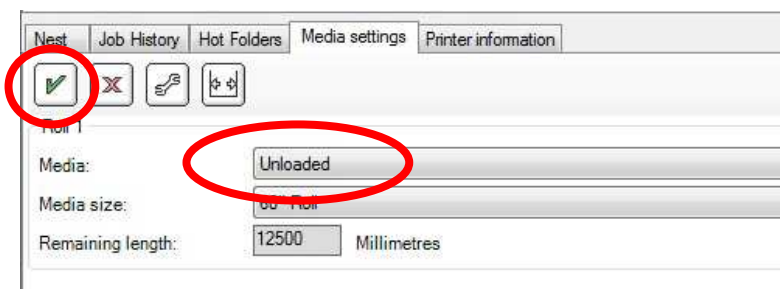

In order to increase productivity even further when submitting jobs in PosterJet 8 templates can be generated and applied to transfer a wide range of settings to a single or multiple print jobs with only one mouse click. Job templates are files that contain all job parameters like scaling, number of copies, borders, color management settings etc. Job templates can be applied to any file and for any kind of job in order to facilitate job submission even further.

Example:

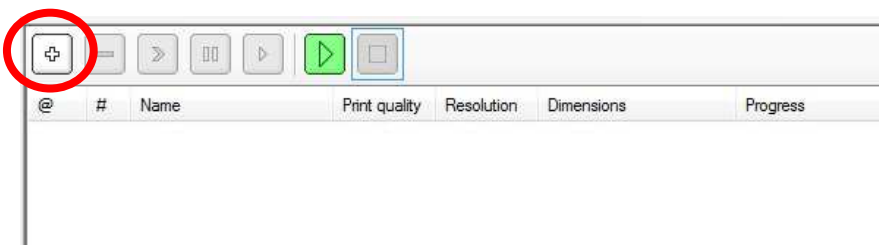

You wish to submit a series of jobs with identical settings without having to open each job individually and make all the necessary settings. Here, PosterJets job templates are the right tool. Once created, one or multiple jobs can be selected and with only one mouse click a specific template can be applied, changing all parameters of the job(s) to the one in the template.

To create a job template please proceed as follows:

Open the „Media settings“ tab of the PosterJet main window. Select „Unloaded“ from the media list and confirm your selection by clicking onto the green ‘Submit’-button. With this you ensure that your template will later work with any media in your media list.

Now select a file (any) by clicking on the green ‘Plus’-button. The same way you would submit a regular print job to the main queue.

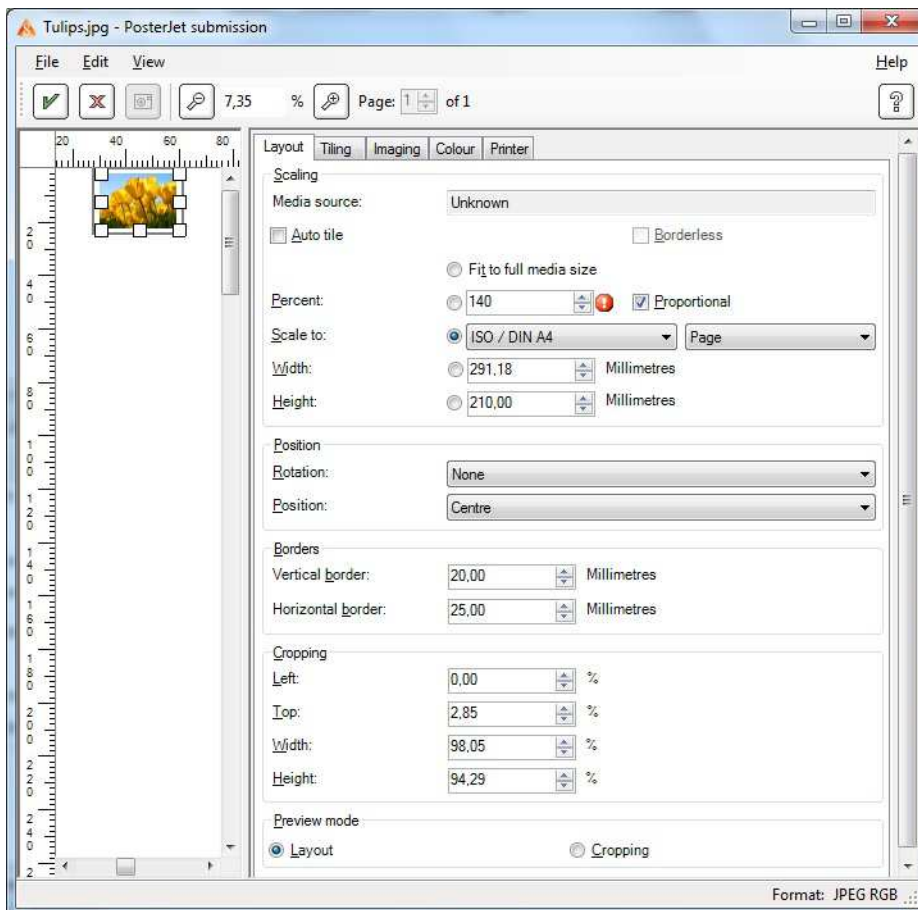

You will now be asked if you wish to continue, since no media was selected (“loaded”). Please confirm with ‘Yes’ (see screenshot on page 2).

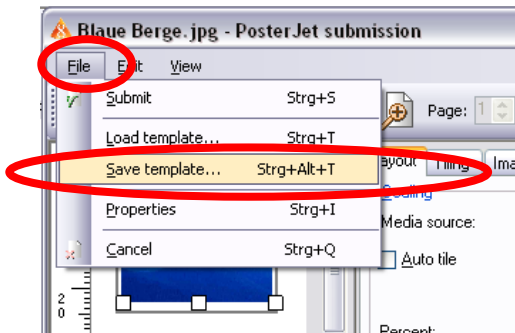

The job submission window will open as usual. Please set the needed value for any setting that you wish to change in later jobs. Change things like the value for scaling, number of copies, borders, rotation, alignment, color settings, type of crop marks, cutter yes/no, layout yes/no, and many more. Provided that you leave a value unchanged, PosterJet will later use the default value for this setting.

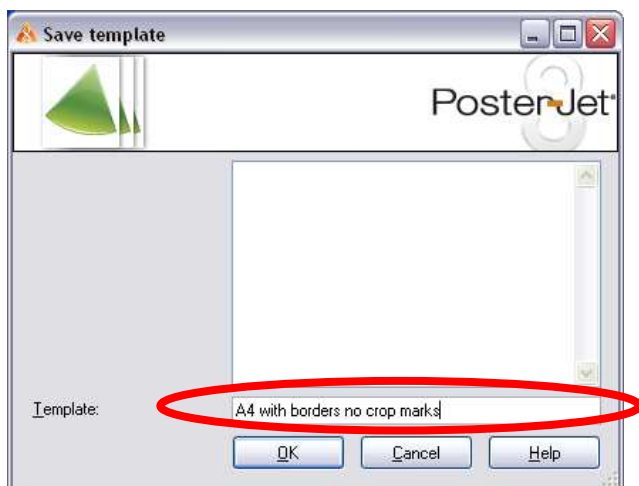

Example for the alteration of values in the 'Layout' tab of the PosterJet submission widow.

You are free to change any setting in the PosterJet submission window. Once you have completed all your entries, choose the option 'save template' from the 'File' menu of the submission window.

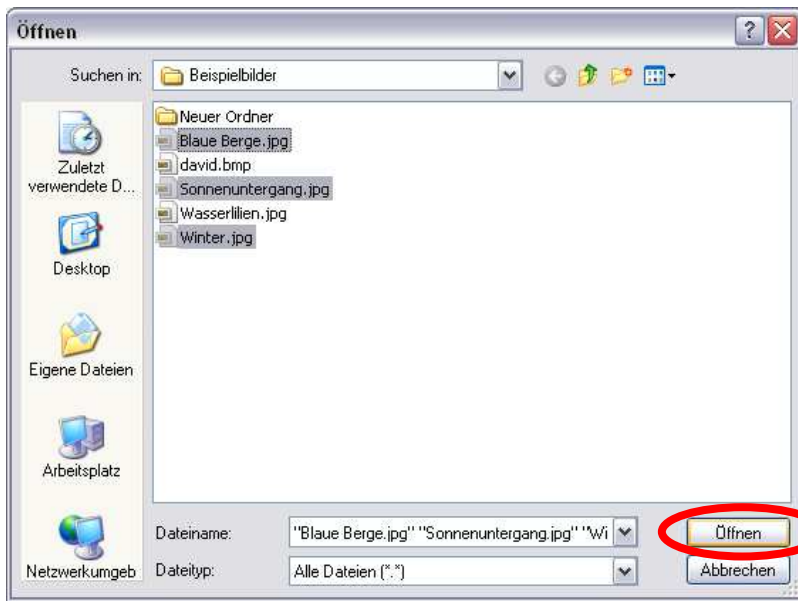

A new window will open and you will be asked to enter a name for the newly created template. We recommend you use a name that perfectly describes the template settings, so you will remember them once you wish to use them in the future.

Click the OK-button to confirm your entry and to save the template.

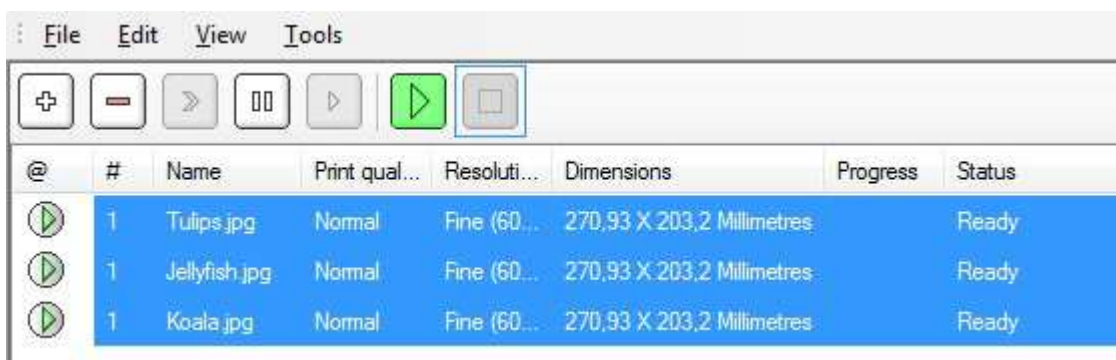

If you now wish to print a series of jobs with identical settings proceed as follows:

- Select a media in the 'Media settings' tab of the PosterJet main window on which you wish to print the jobs (e.g. Matt Coated Paper 120gr).
- Select the file(s) that you wish to print (you can add multiple files to the PosterJet main or nest queue via drag & drop. Or just click onto the 'Add'-button in the queue and select multiple jobs from the file manager window with the SHIFT- or CTRL-key (exactly like in your Windows explorer).

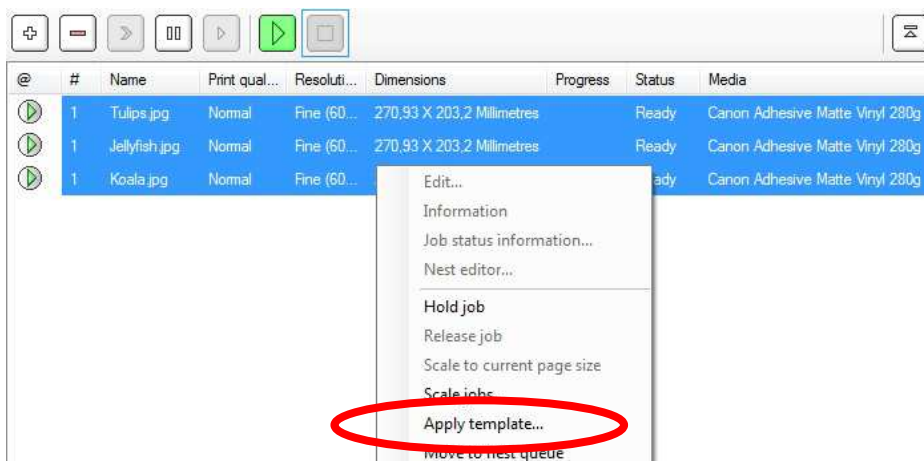

Selection of multiple files for printing in PosterJet using the mouse and the CTRL-key (on German Windows OS).

As soon as all jobs have been added to the queue select one or multiple entries (if wished even all).

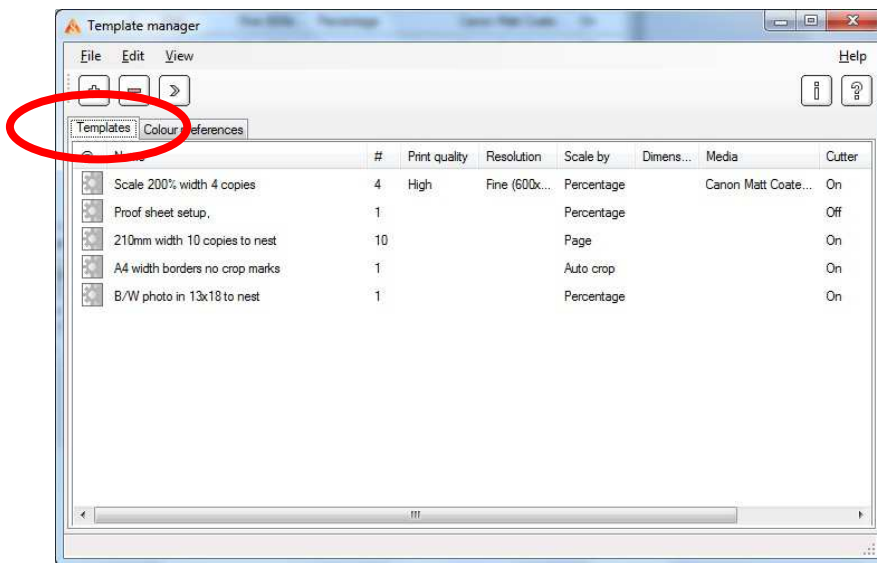

Use the right mouse button to open the context menu and select the option 'Apply template'

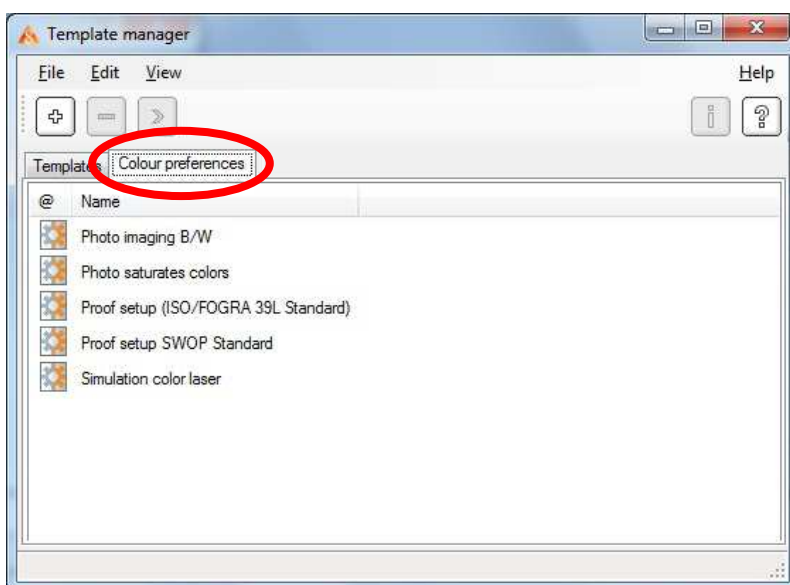

Select a template and confirm to apply it to the selected jobs by clicking the 'OK'-button.

Hint: PosterJet 'Hot Folder' work in perfect harmony with job templates. Any PosterJet Hot Folder can have a job template linked to it. This feature allows the installation of a fully automated production (also on multiple printers!).

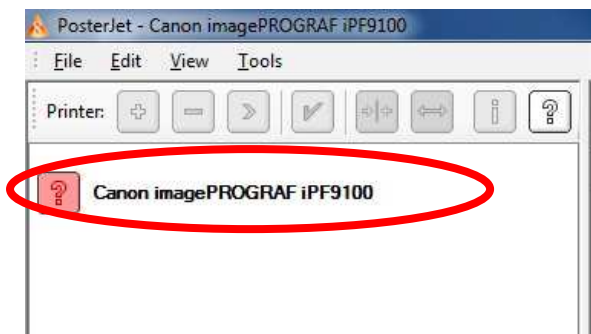

In PosterJet you will also find a Template Manager that allows you to store, delete, or edit your templates. The Template Manager can be found in the 'Tools' menu of the main window. In addition so called color templates can be created that will only modify the color settings of jobs (same settings as in 'Color' tab of PosterJets submission window) but leave all other parameters to default.

OR

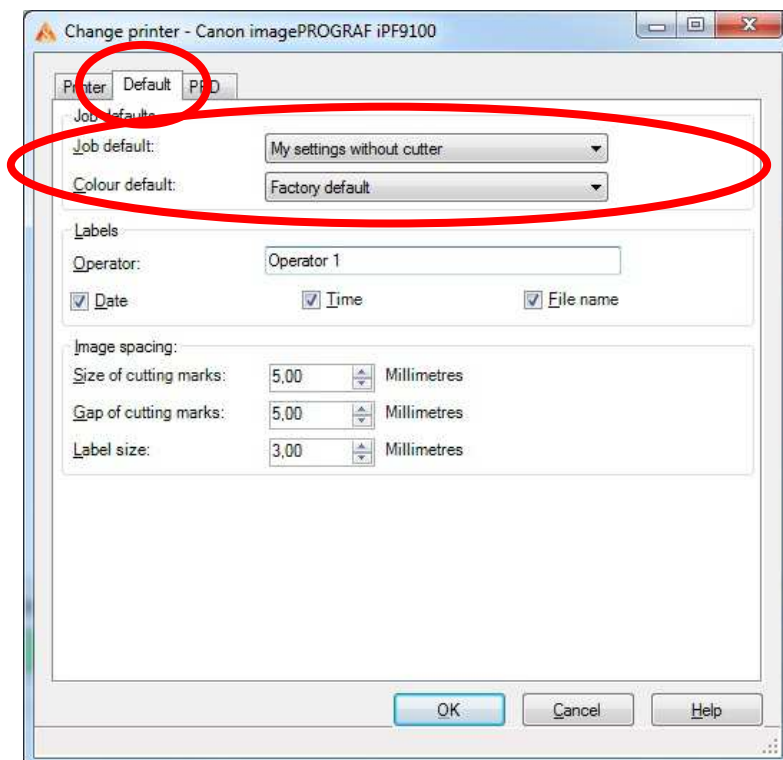

Hint: you can make any template your standard one for your complete workflow (all files that are added to PosterJet for printing will automatically be changes to the values stored in the template. Example: cutter always 'off'). For this, open the printer settings in the printer list of the main window (double click on printer in list on left side of the window).

double click here

Change to the 'Default' tab and select any template to become your new job or color standard.

From now on all jobs added to the main or nest queue will automatically be changed to the settings defined in the template selected above. Of course, you will have the flexibility to still modify any setting individually at a later stage once the jobs are in the main or nest queue (double click, open job submission window and change setting individually).

### PosterJet 8.7 and Windows 7, 8 or 10

PosterJet 8.7 runs perfectly under all Windows OS (Windows XP or higher) if the following settings are considered during installation:

1. Please install PosterJet 8.7 by right-clicking the “Setup.exe” from your PosterJet installation DVD or the locally unzipped folder of your download and choose “Run as administrator”.
2. Install PosterJet as described in Support Guide No. 1 and 2.
3. Run PosterJet 8.7 Admin Tool always as administrator (especially as long as the Windows User Account Control is activated). This can be done by right-clicking the Server and Client application and choosing “Run this program as an administrator” under “Properties” -> “Compatibility” -> “Privilege Level”. Click on “Apply” and “OK”. You will have to restart the Admin Tool if activated before the changes become active.

The PosterJet Admin Tool application can be found here:

C:\Program Files\Eisfeld Datentechnik\PosterJet V8 Admin Tool\PosterJetAdmin.exe

The PosterJet Client application here:

C:\Program Files\Eisfeld Datentechnik\PosterJet V8 Client\PosterJetClient.exe

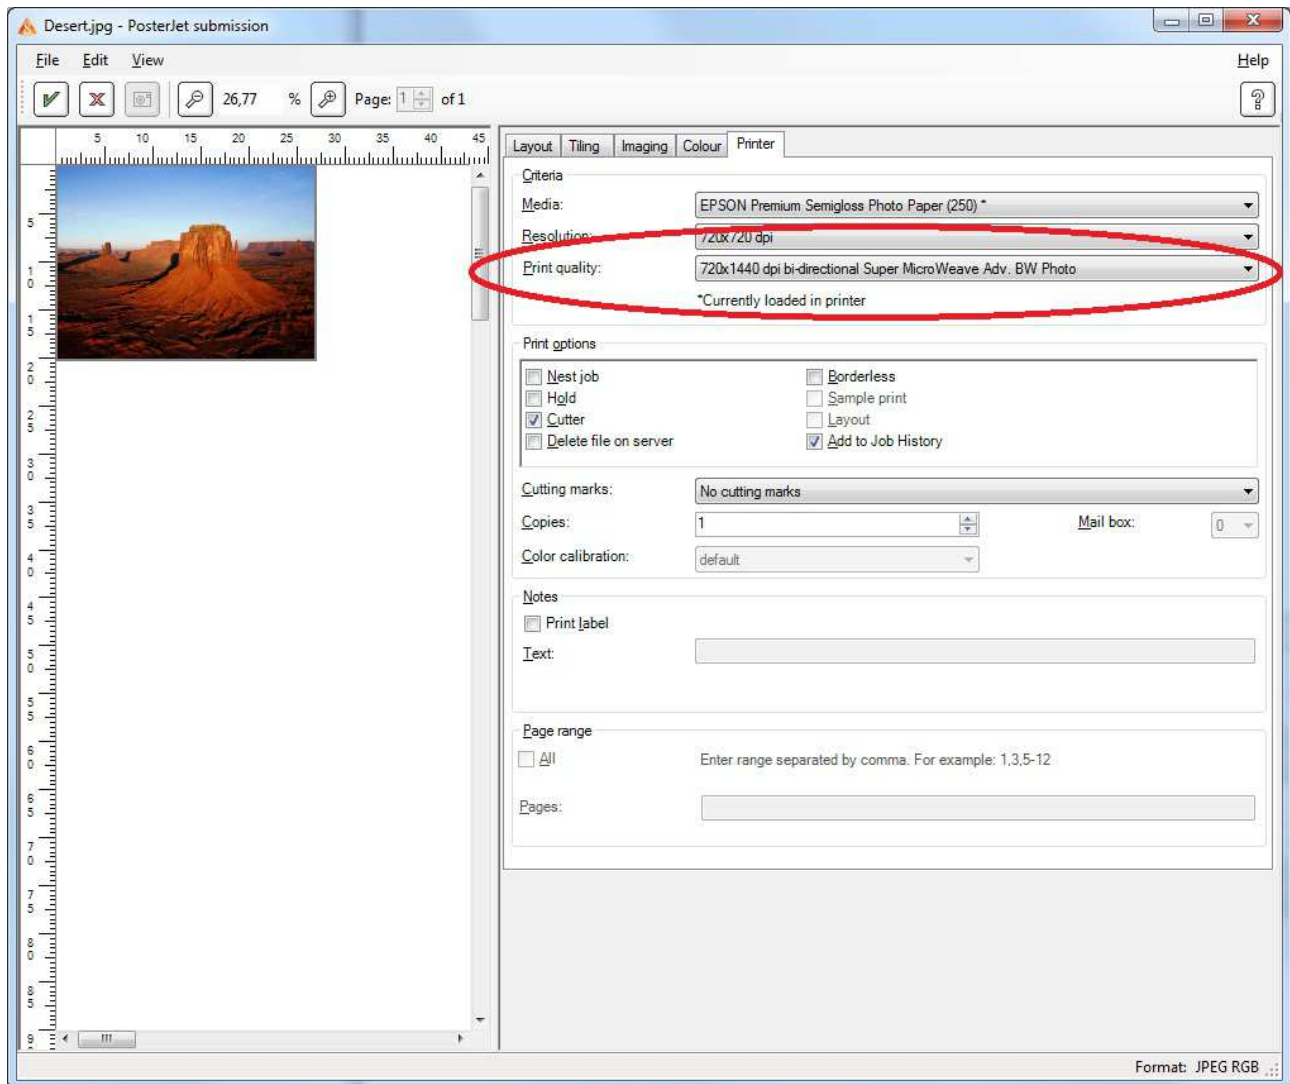

or

C:\Program Files (x86)\Eisfeld Datentechnik\PosterJet V8 Client\PosterJetClient.exe

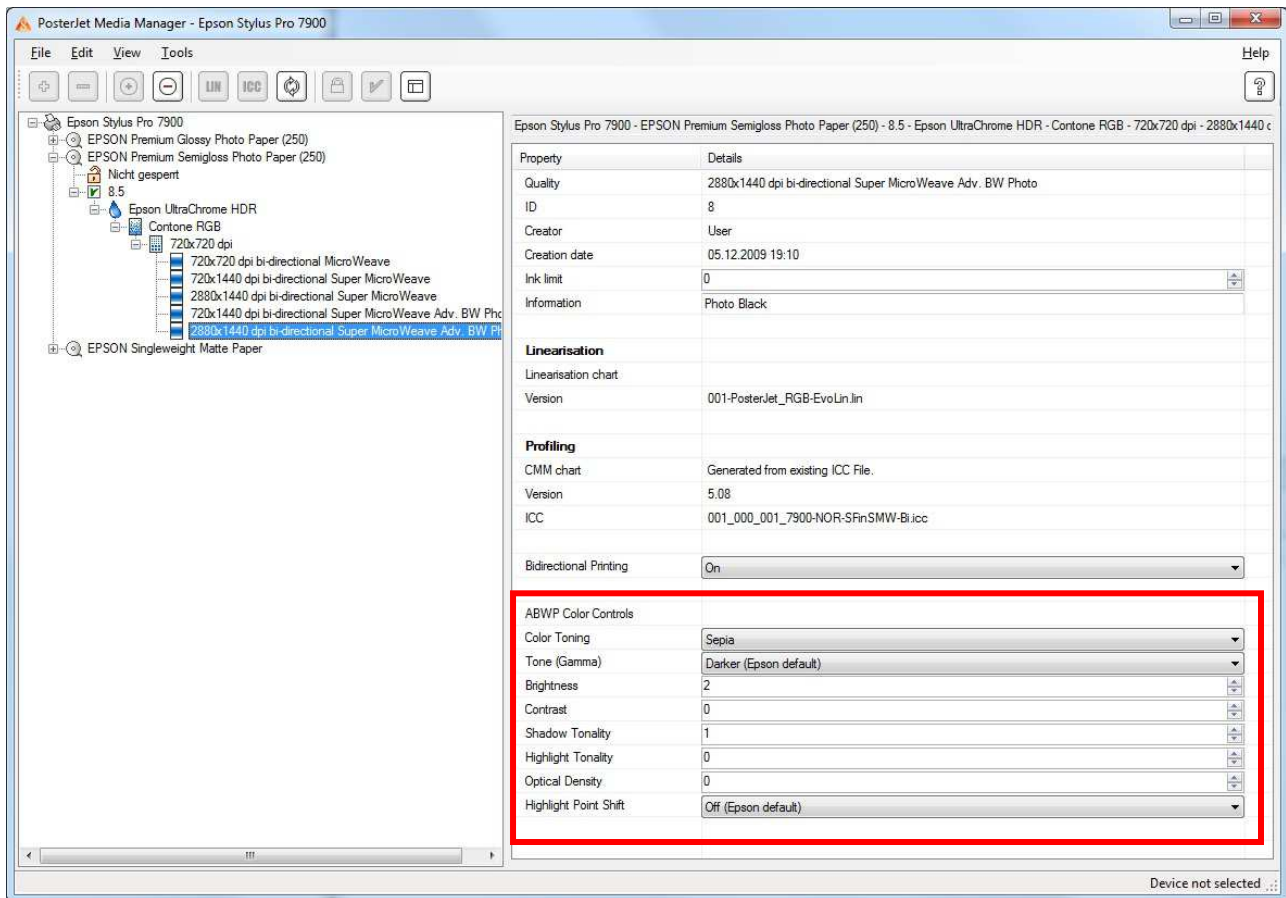

4. Printing documents through the virtual printer driver (PPD) requires the use of our software tool called "PosterJet Tool Ver2.exe". Please read Support Guide No. 5 for further instructions.

### Professional black/white output with Epson Stylus Pro printer

With PosterJet 8.5 we have created the possibility for you to produce professional black and white prints from any file without prior conversion on Epson Stylus Pro printer. No matter if you take a color image or a PDF file, PosterJet 8.5 will - on your request - do the conversion automatically for you. In addition you have a number of choices to create a variety of black and white prints (e.g. like Sepia or Duotone). To print files in black and white proceed as follows: open the job and go to the printer tab in the job submission window. Select a print quality ending with “....Adv. BW Photo”.

You will find the different settings for your BW prints in the PosterJet Media Manager. Before you print your file, open the PosterJet Media Manager (menu “Tools” from main queue). Select your media and open the media tree to access the print modes by pressing F6 (or click the little plus buttons). Click on the print mode you will be using. You will now see the „ABWP Color Controls“ you might want to change.

### Notice:

- Not all paper types do have Adv. BW Photo print modes.
- Not all Epson Stylus Pro printer do support Adv. BW Photo print modes.
- A preview of the later results is unfortunately not possible. We recommend that you perform a test print first in order to check the effect of your changes to your output.
-

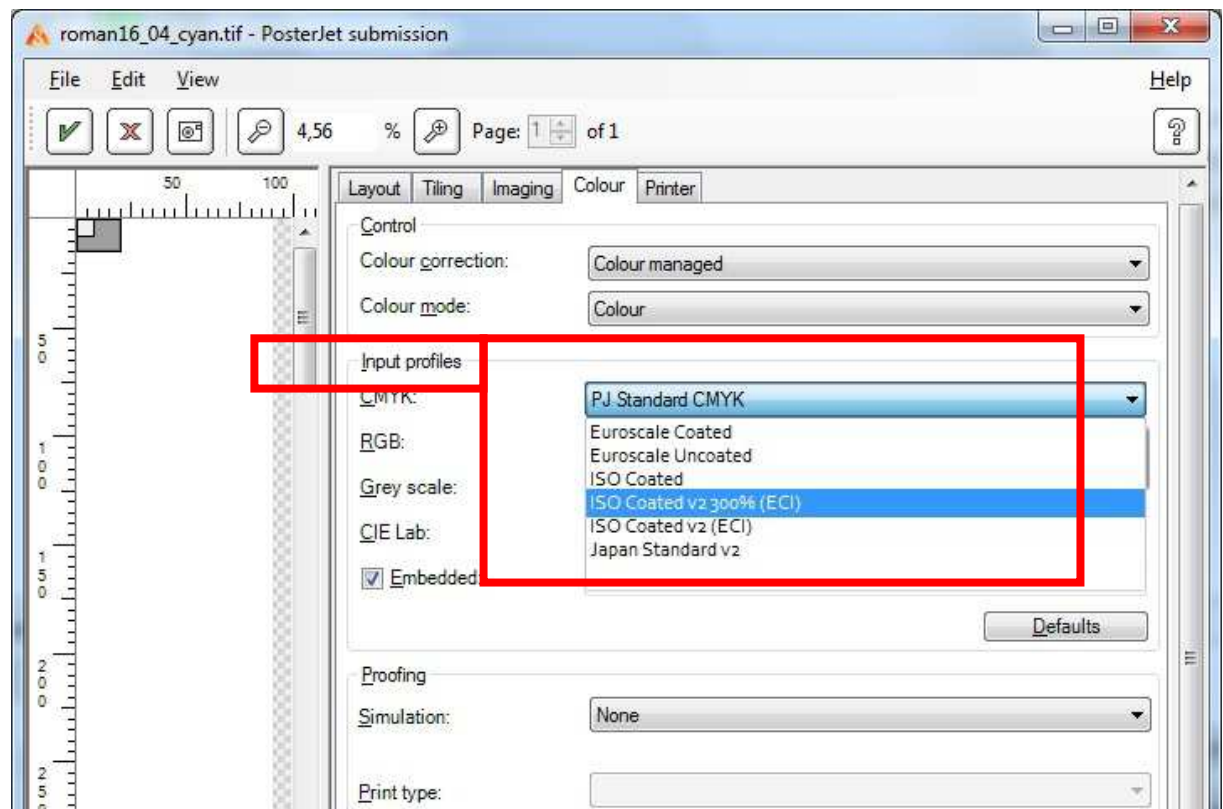

### Installation of ICC or media profiles in PosterJet 8.7

#### 1) You wish to install an Input profile in PosterJet 8.7? Just proceed as follows:

Click with the right mouse button onto an ICC profile that you wish to install. Select the option "Install ICC Profile".

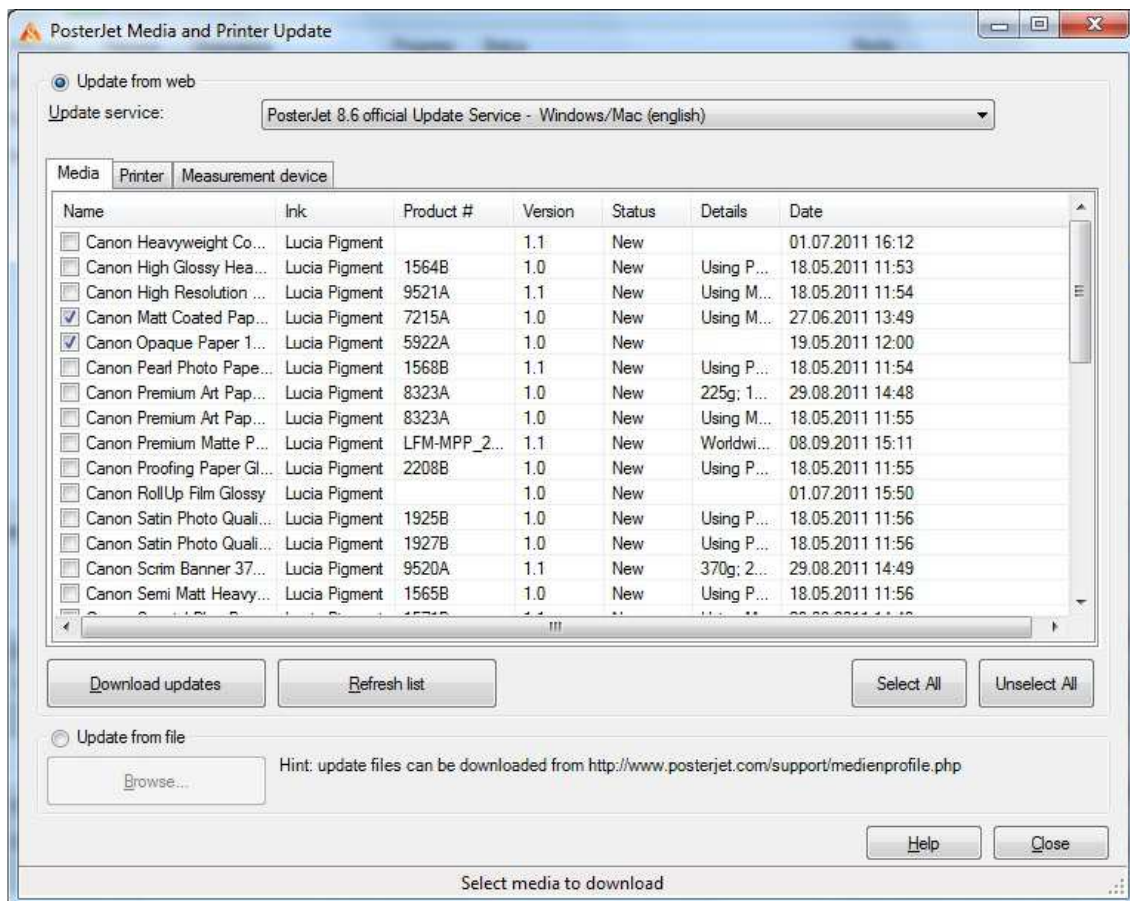

Restart PosterJet (Server and Client). The new profile is now available within PosterJet. You will find it in the „Colour“-tab of the PosterJet Submission window under „Input profiles“.

### 2) There are two options to install new media in PosterJet 8.7:

- Install new media through PosterJet Media Update Service via internet. For this, please go to the “Tools” menu of the main Client window and select the option “Media Update...”.

PosterJet will now connect to the PosterJet Live Update Server, if an internet connection exists. The Update Service will list all updated or new media.

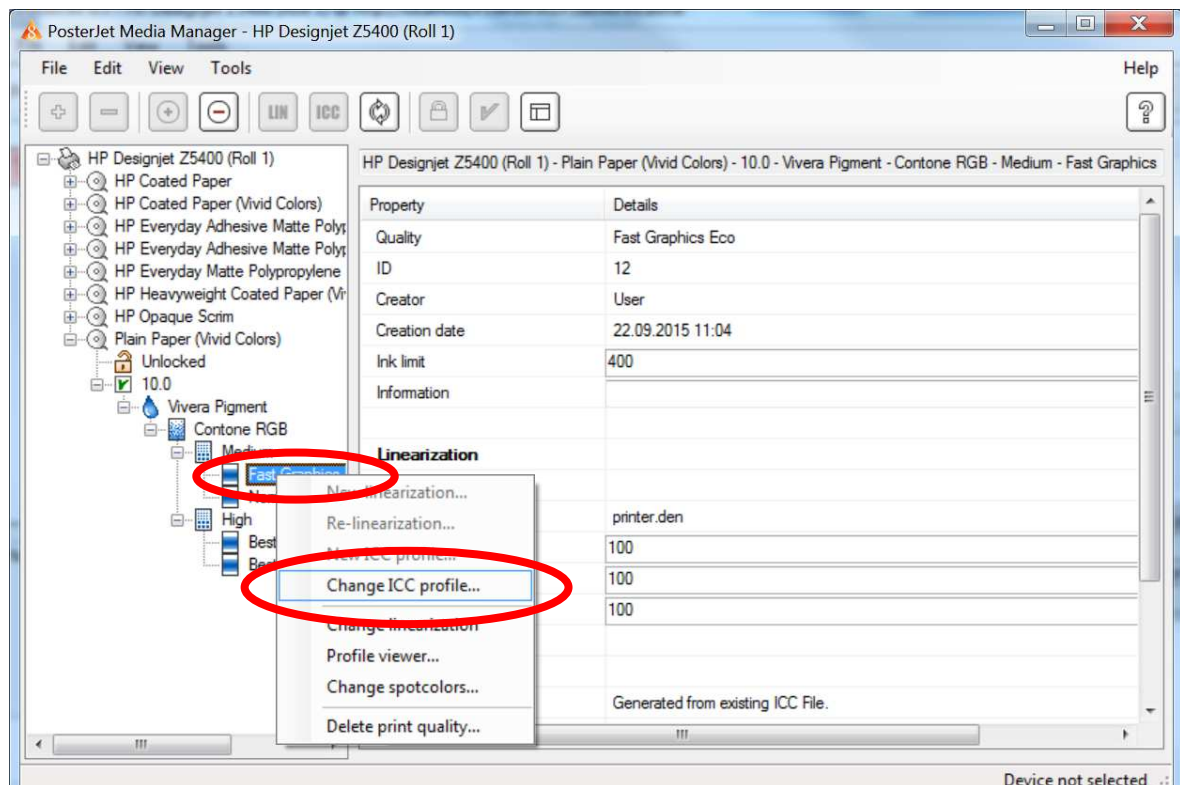

Select the media you wish to download. Click button “Download updates“. PosterJet will install all selected media automatically. These can be used immediately, without the need to restart PosterJet.

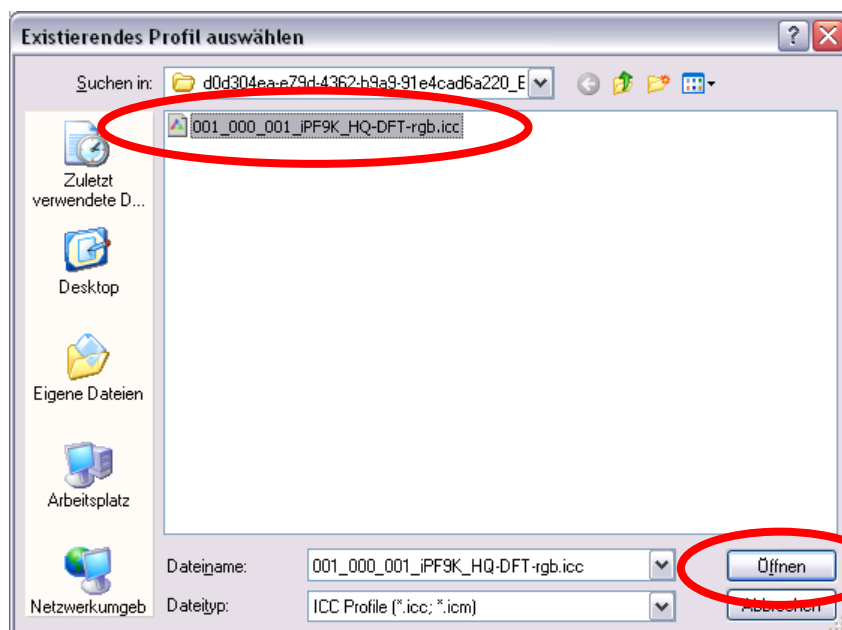

- If you wish to install a new media from a ZIP file that you obtained via email or through download from our website, chose the option „Update from file“ from the window above. You will be asked to select the ZIP file. Click the “Open” button in the dialog box and the media file(s) will be installed automatically.

### 3) How to import and ICC media profile to an existing media?

- Open the PosterJet „Media Manager“ from the Tools“ menu of the PosterJet Client. Select the media for which you wish to import the ICC file. First open the media tree by a click onto the F6-key of your keyboard. Select the corresponding print mode using the right mouse button and select the option „Change ICC profile“ from the context menu.

Select the IIC profile in the explorer window and click “OK” to confirm your selection.

PosterJet will from now on use the new ICC profile for the specified paper and print mode.

### Color management with Adobe Creative Suite

When exporting files from components of Adobe's Creative Suite you must ensure that the correct color management settings are chosen in the preferences, otherwise you will obtain wrong output (wrong colors, or too dark colors etc.).

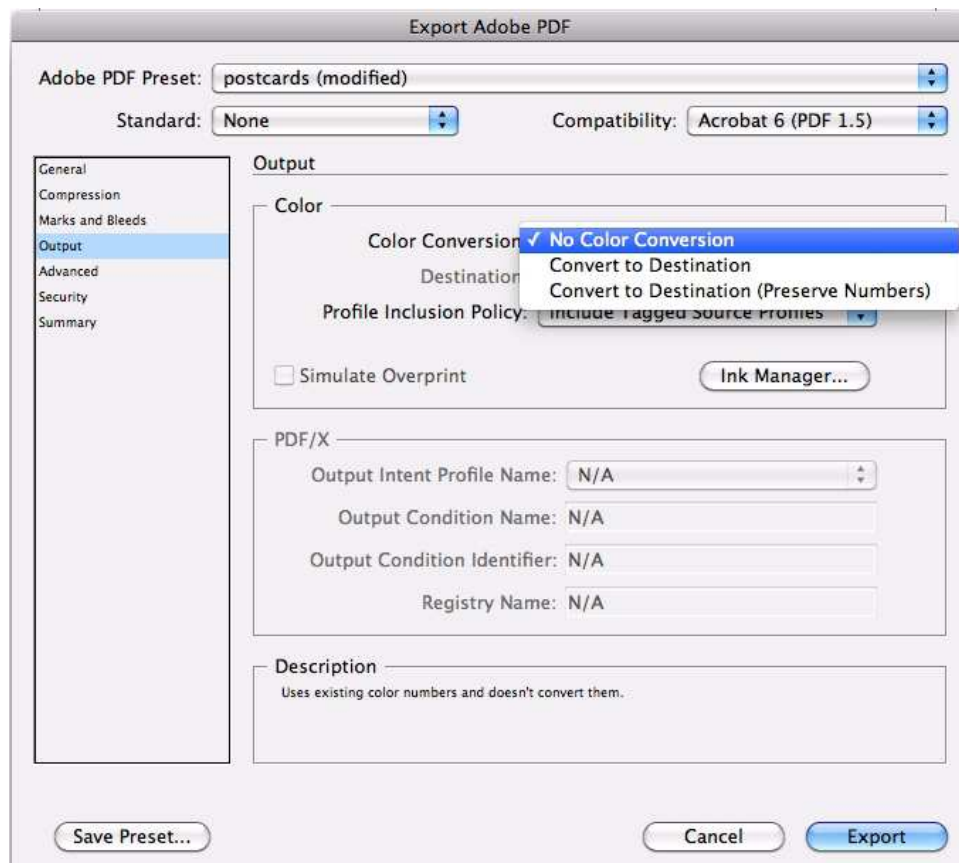

To check that you have selected the correct settings please perform the following little test:

Open a file in Photoshop that you know well and save it as Tiff format. Don't forget to save it with the option to embed the ICC profile. Now print the file with PosterJet.

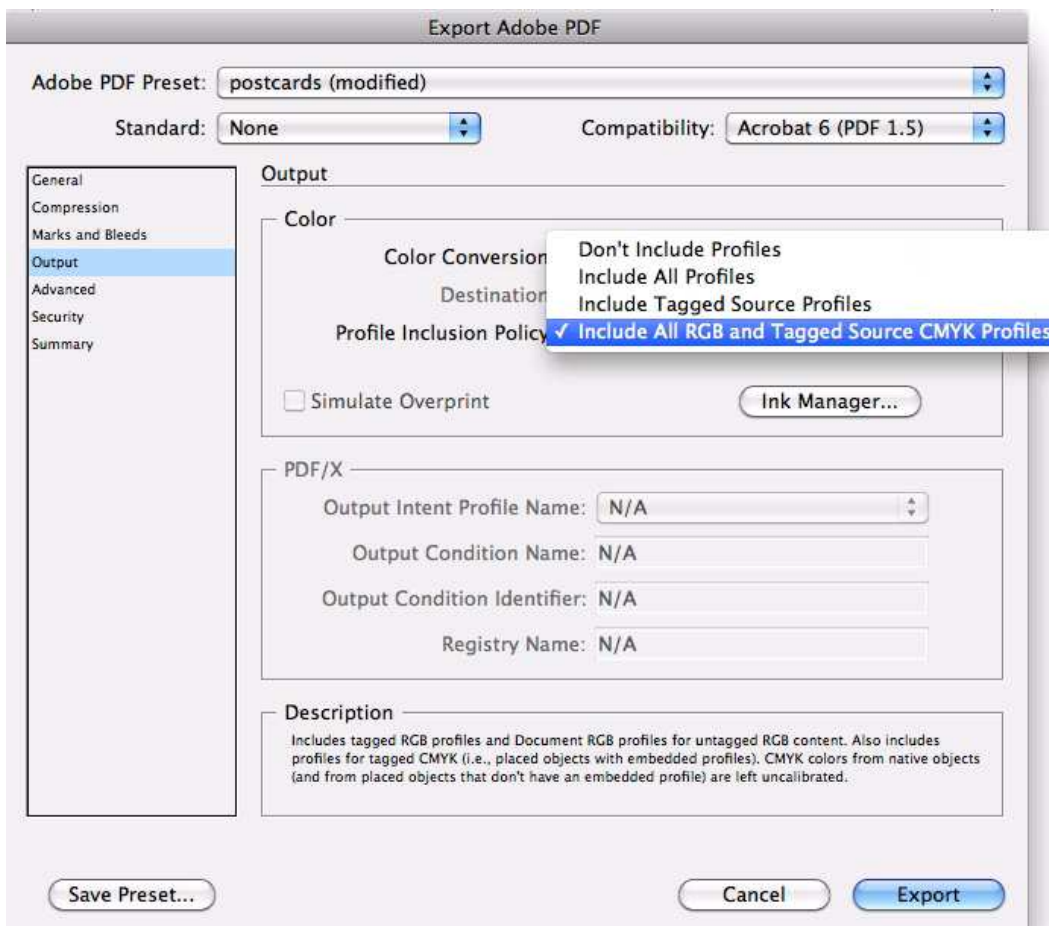

Import the same file in InDesign. Save the file as PDF and print it with PosterJet.

If the prints differ in color the settings in InDesign are incorrect and therefore have to be changed. How to change color settings in InDesign:

1. Choose the entry „Output“ -> „Color Conversion“ -> „No Color Conversion“ in the export window.

- Choose the entry „Include All RGB and Tagged Source CMYK Profiles“ under “Output“ -> „Profile Inclusion Policy“ in the export window.

Now save these settings and reuse them or define these settings as standard settings.

Try to print the new PDF again and check if both your prints (Photoshop and InDesign) now match.

-

## PosterJet 8.7 and Windows Power Save Options

If Windows 7, 8 or 10 is operated with standard settings it will switch to sleep mode (power save mode) after a short inactive period. If PosterJet is running, it is sometimes possible that the PosterJet client loses the connection to the PosterJet server. In this case the PosterJet client has to be restarted to re-connect to the PosterJet server.

To avoid this please adjust the power options under Windows.

1. Go to "Start" -> "Control Panel"

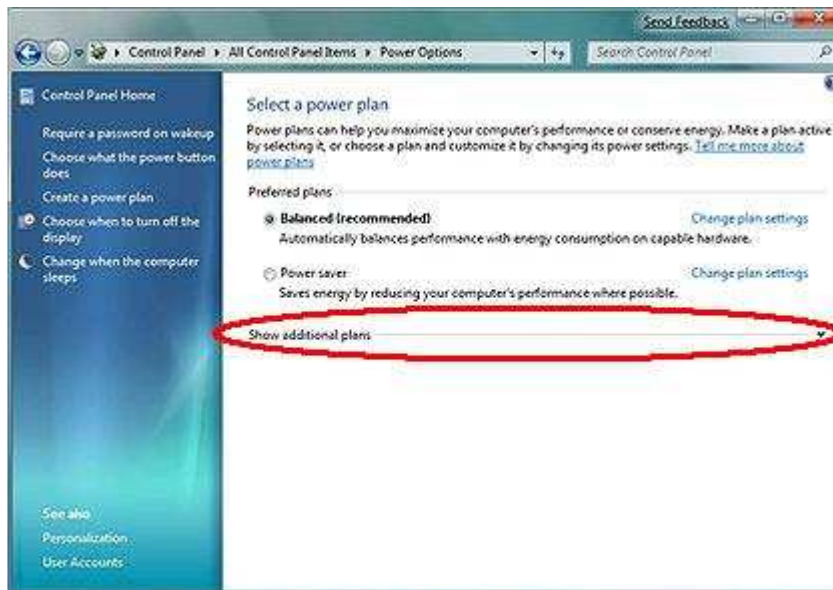

### 2. Choose „All Control Panel Items”.

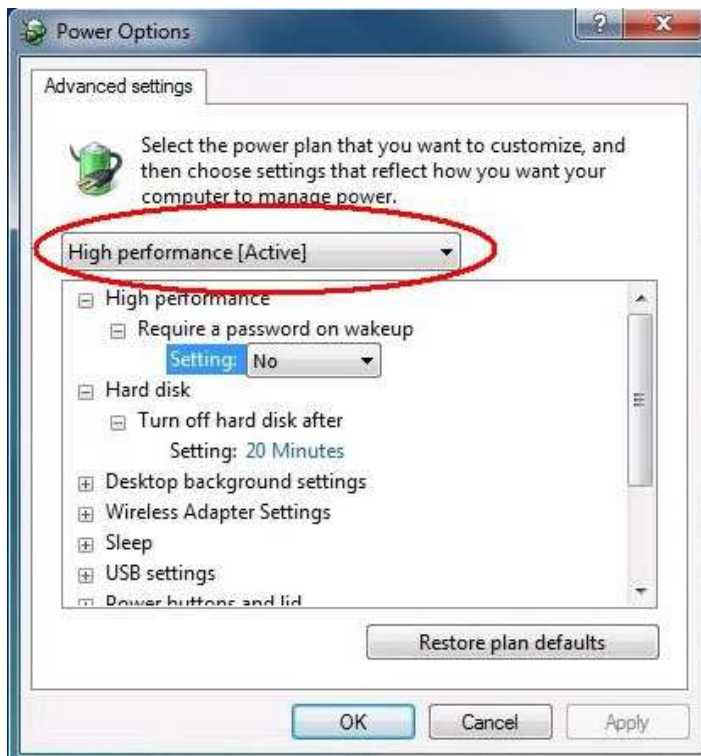

### 3. Choose „Power Options”.

4. Choose „Show additional plans“.

5. Choose „High Performance“ from the drop down menu.

PosterJet should work as required.

## PosterJet installation under Windows Internet Information Services

PosterJet 8.7 Server can be hosted as a web service under Windows Internet Information Services (available on any Windows OS, but mainly designed for server operating systems).

### Requirements:

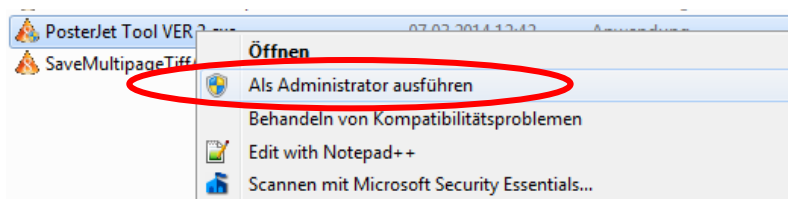

- Administration privileges under Windows
- PosterJet 8.7 Installation DVD
- PosterJet Tool Ver2.exe application (also available as download under: <http://www.posterjet.com/mehr-downloads/> -> PosterJet PPD and IIS Installer)

### Step 1

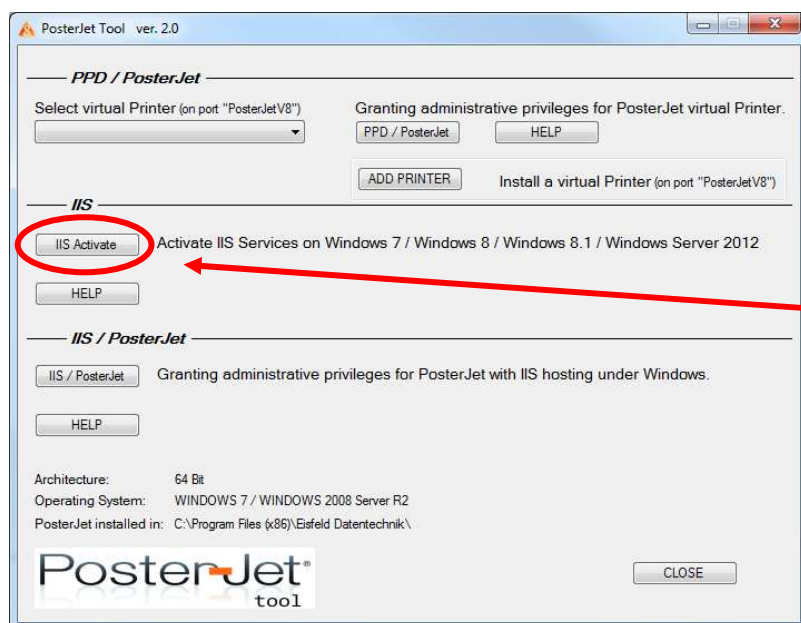

Install PosterJet Server and Client under Windows. Do not restart the PC at this moment.

### Step 2

Run the application „PosterJet Tool Ver2.exe“ by right clicking the entry and selecting the option „Run as Administrator“ from the context menu.

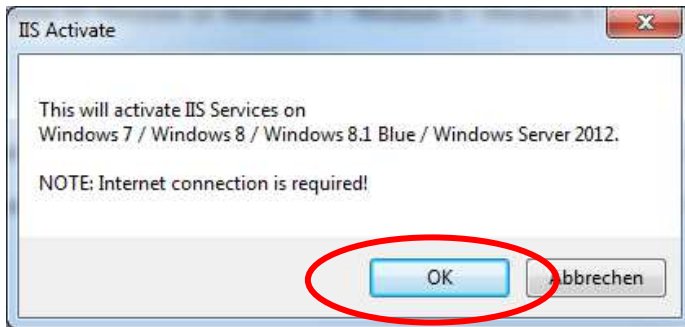

The following window appears:

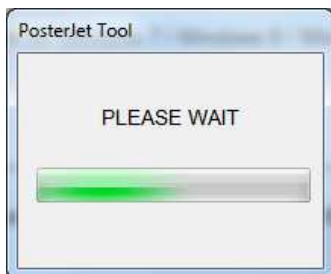

Click „IIS Activate“, if the Windows Internet Information Services have not yet been installed.

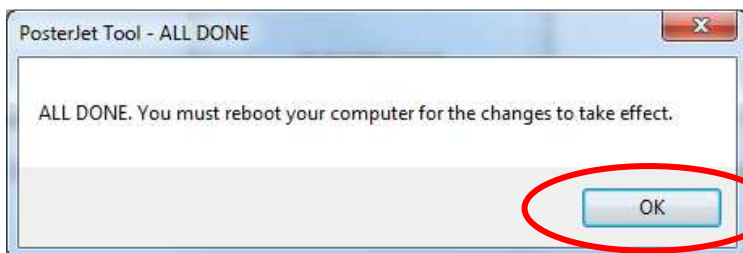

Click the „OK“-button to start the installation of the Windows IIS. An internet connection may be required for Windows to download the latest system files.

The following window appears during the installation.

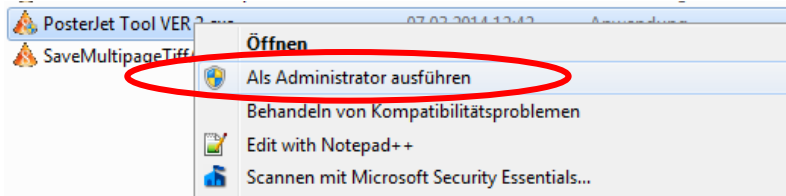

Please wait until the installation is completed. The installation may take a few minutes depending on the speed of the computer. Once finished, you will be asked to reboot the PC.

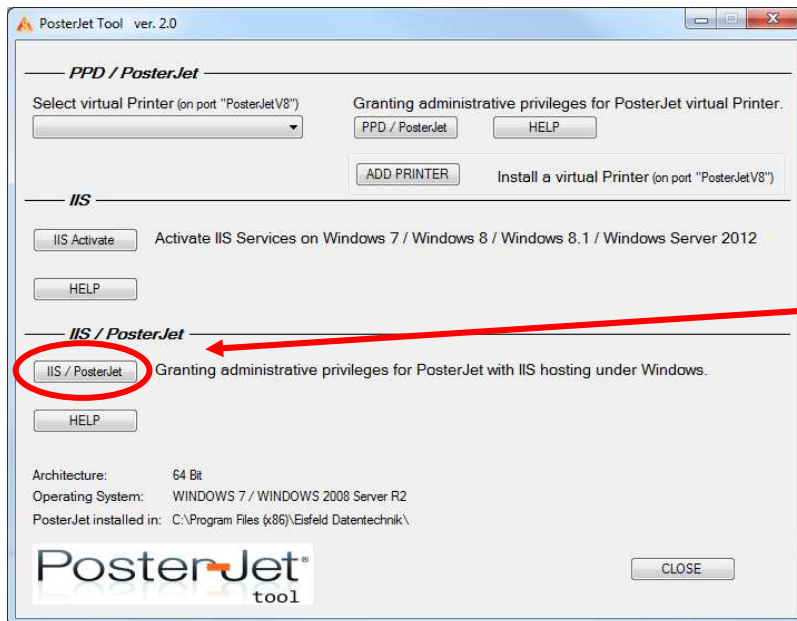

Complete the process by first clicking onto the „OK“-button and then by closing the „PosterJet Tool ver 2.0“ window. Restart the PC (is absolutely required).

### Step 3

PosterJet must now be registered under the Internet Information Services (a new Application Pool must be created, a new Default Web Site must be added, and some important parameters must be set along with necessary permissions. All tasks can easily be performed using the „PosterJet Tool Ver2.exe“ application. It is important that you run the „PosterJet Tool Ver2.exe“ as an administrator (right mouse click onto application to open the context menu).

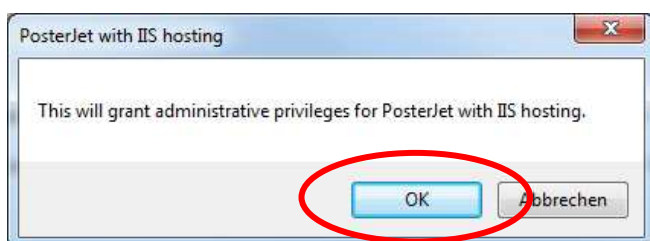

The following window appears:

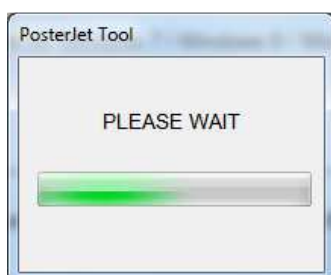

Creating Application Pool, adding the Default Web Site, and setting the necessary parameters and permissions with a click onto the „IIS / PosterJet“-button.

Click the „IIS / PosterJet“-button in order to continue with the registration of PosterJet under the IIS.

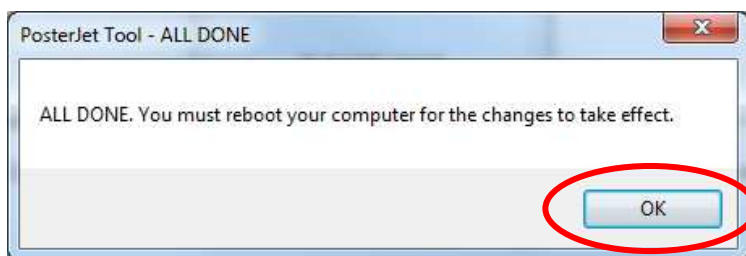

The following window appears:

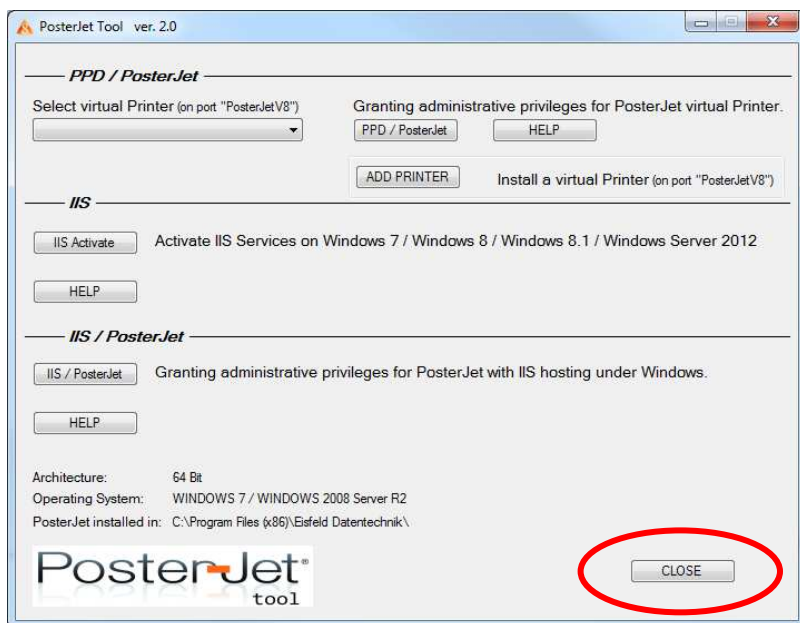

Click „OK“ to proceed. Please wait until the registration is completed. The process may take a few minutes.

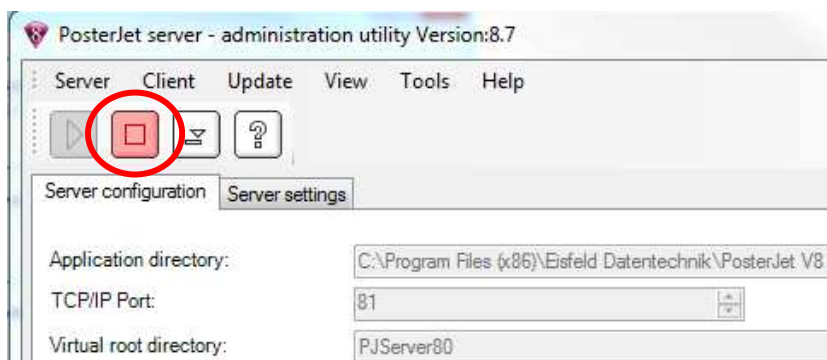

Once the registration is completed you will be asked to reboot the PC again. Click “OK” to close the window.

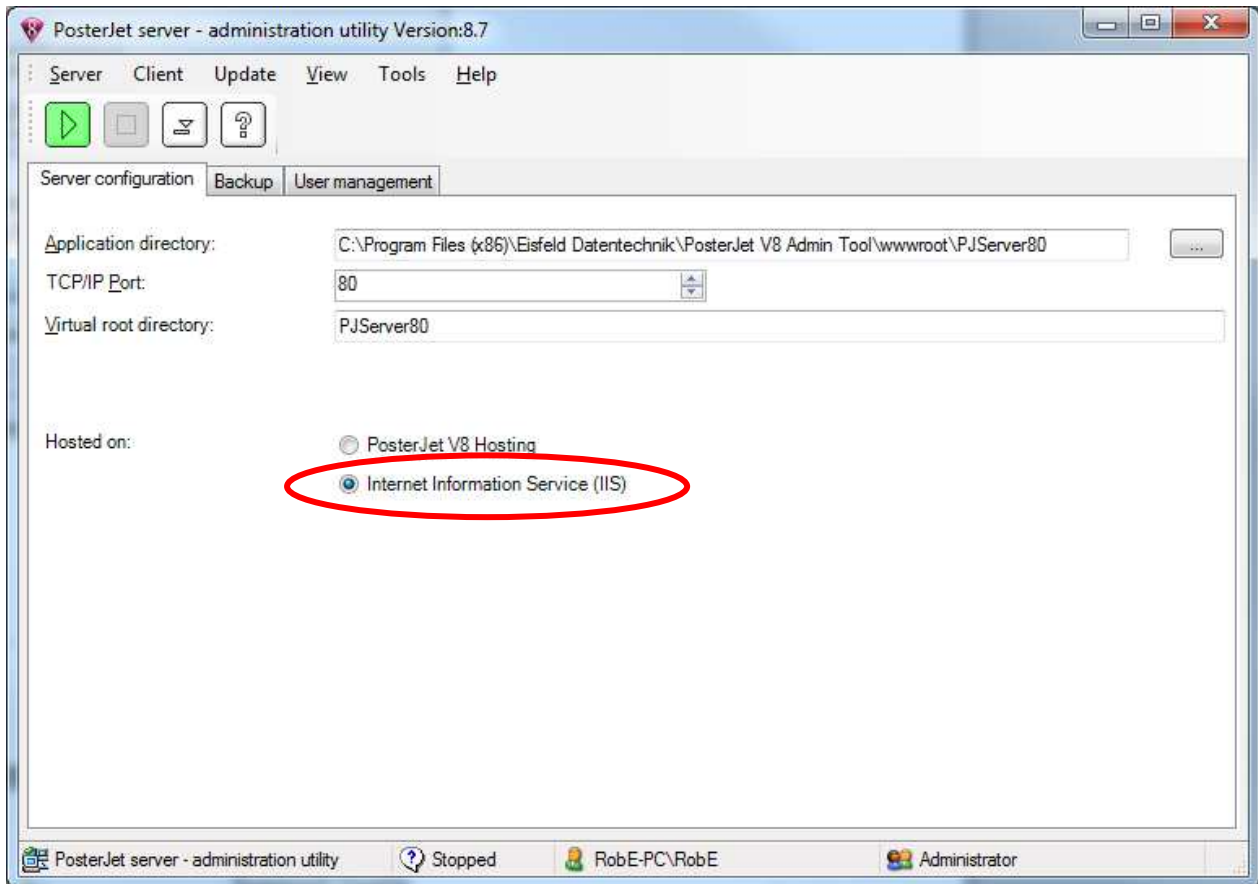

Exit the application „PosterJet Tool Ver 2.0“ by clicking the “Close” button and restart the PC so that the changes can become effective.

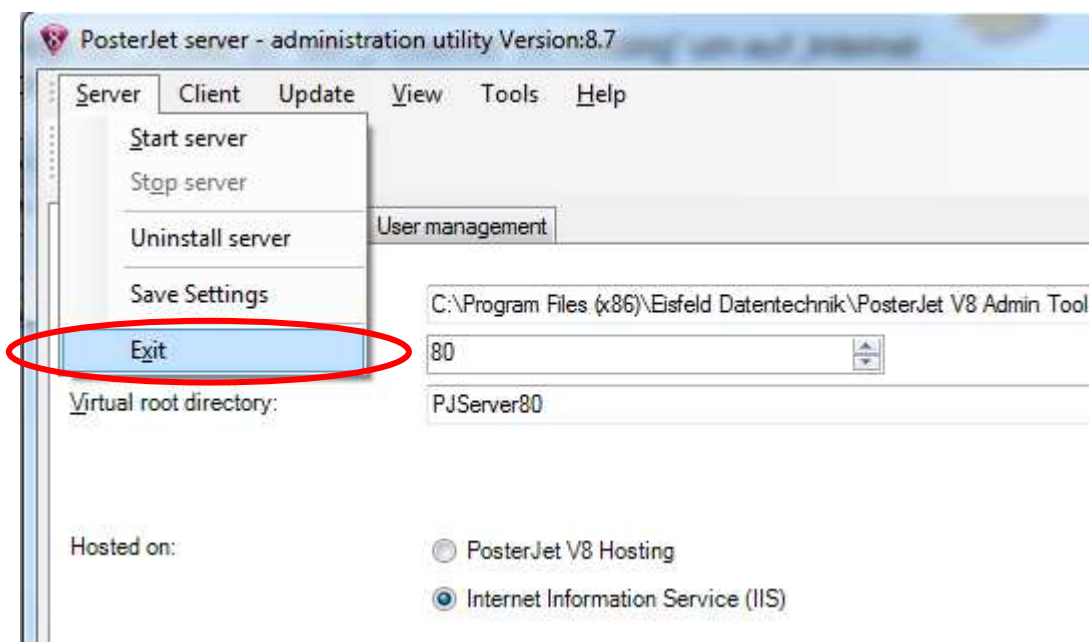

Once the PC has been restarted open the PosterJet administration utility. Stop the PosterJet Server by a click onto the Stop-button.

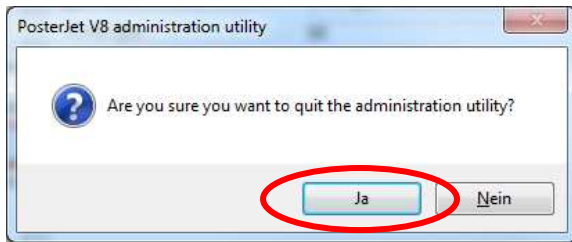

Now switch the option for „Hostet on“ from „PosterJet V8 Hosting“ to „Internet Information Service (IIS)“.

Exit the PosterJet administration utility.

Click „Yes“ to close the application.

Remove the PosterJet administration utility from the Windows Startup Menu. The application will not be needed any longer since the PosterJet Server will be hosted under the IIS. Open the following folder in order to remove the autostart entry for PosterJet Server under Windows:

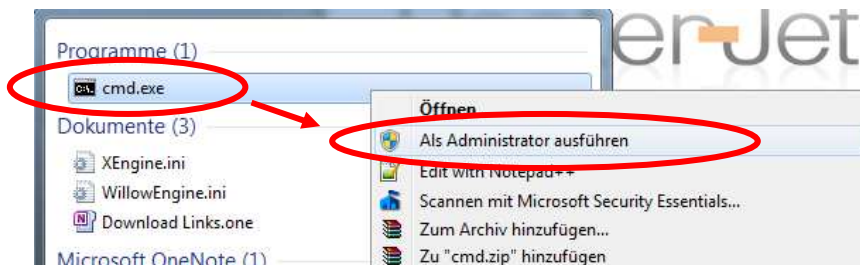

C::\Users" -> "CurrentUser" -> "AppData" -> "Roaming" -> "Microsoft" -> "Windows" -> "Startmenu" -> "Applications" -> "Autostart"

Delete the link for the PosterJet Server from the list.

**Hint:** typically, the Windows auto start folder is hidden and needs to be made visible (for more information check Windows Explorer folder options).

Proceed as follows should you need to restart the PosterJet Server while it is being hosted under the IIS.

- 1) Open the Windows command window by using the option "Run as Administrator".

Type the following Windows command and hit the Enter key from your keyboard:  
iisreset

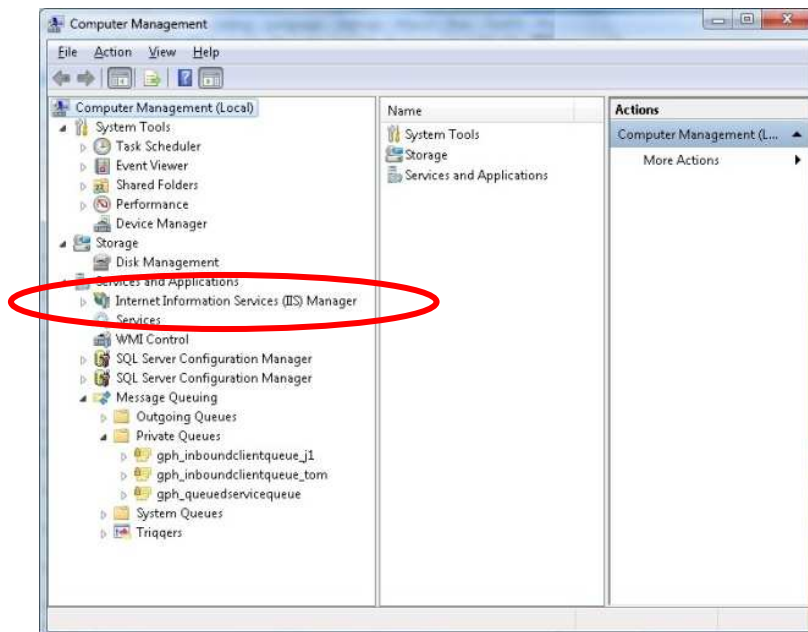

The following window appears once the IIS has been restarted successfully.

**Important notice: never restart the IIS using this option, if other services are hosted by the IIS too (e.g. Outlook Exchange Server). Otherwise, all services are terminated and restarted!**

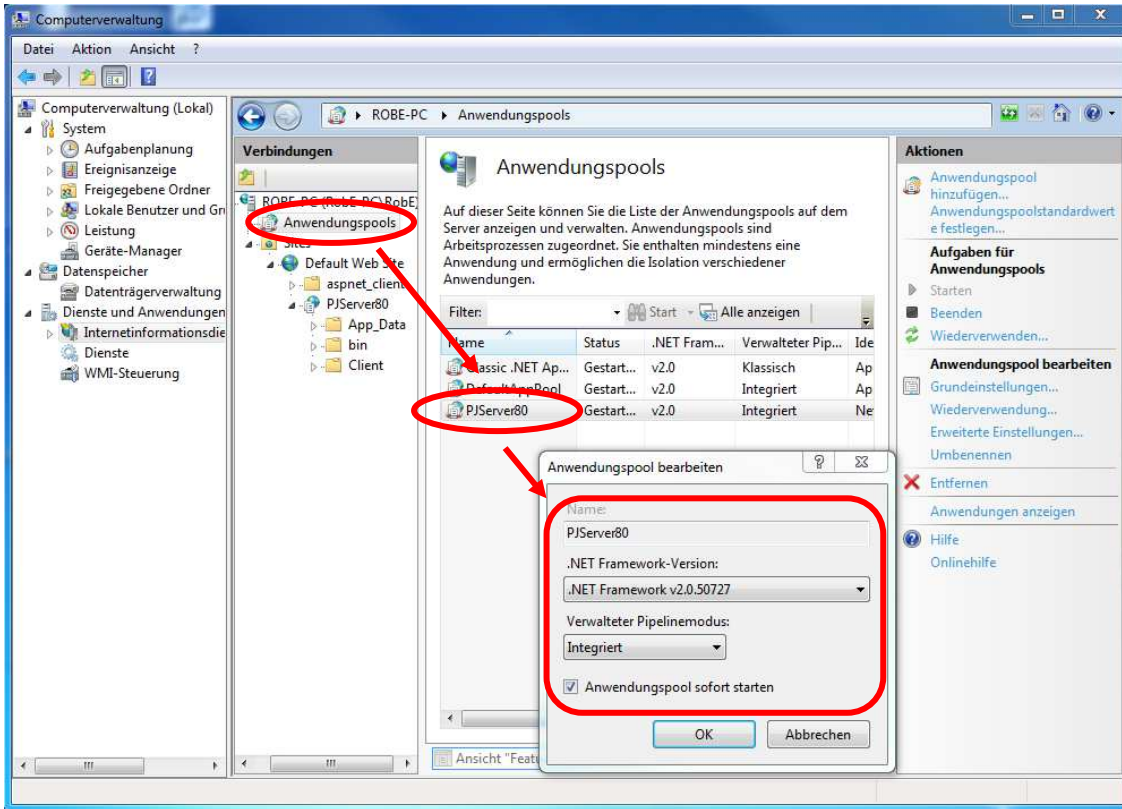

- 2) A different method for restarting just the PosterJet Server when being hosted under IIS is to only stop and then restart the PosterJet Application Pool. Proceed by first opening the computer management.

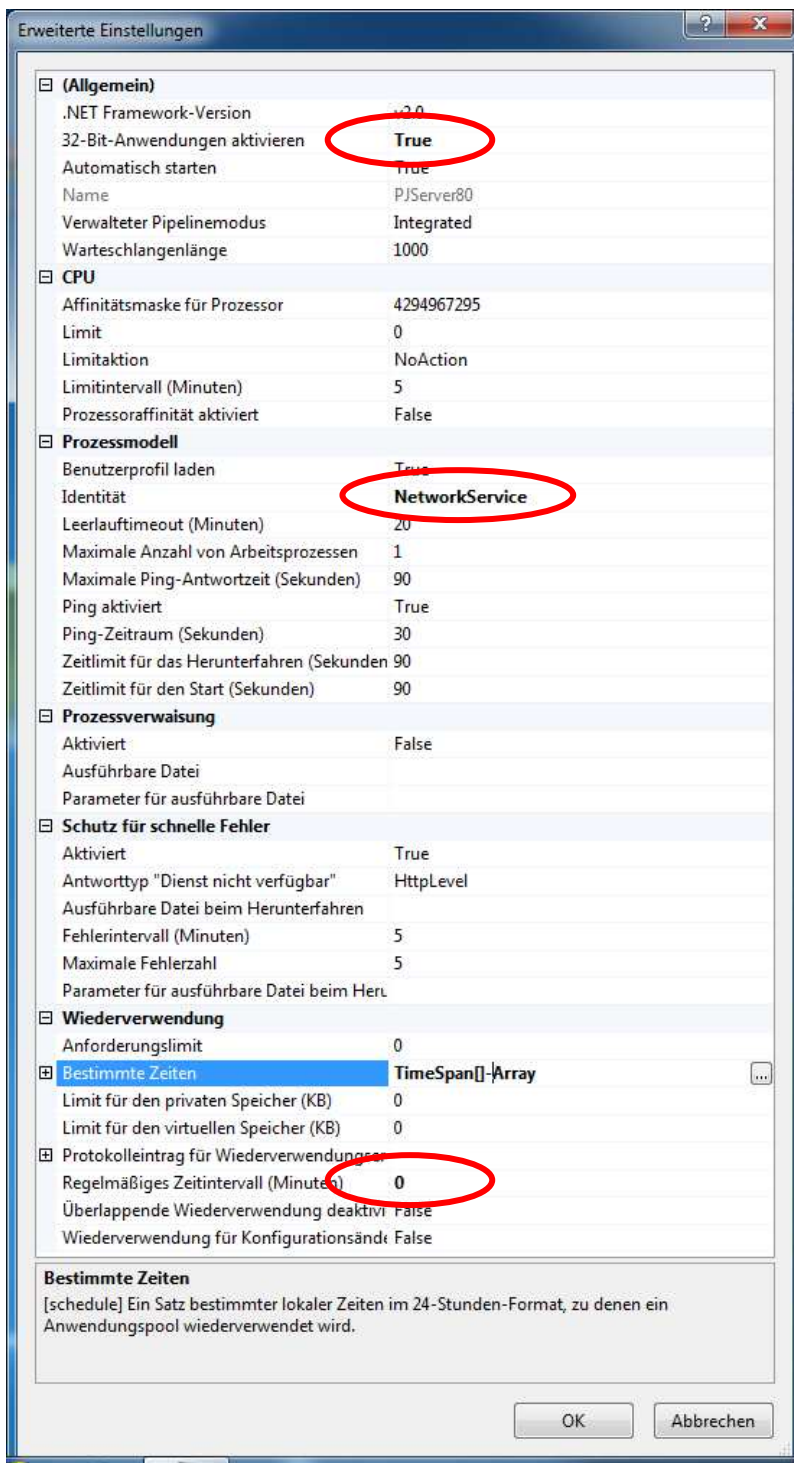

Go to „Application Pools“ and select the „PJServer80“. Stop the Application Pool „PJServer80“ and then start it again.

### PosterJet parameters for Internet Information Services

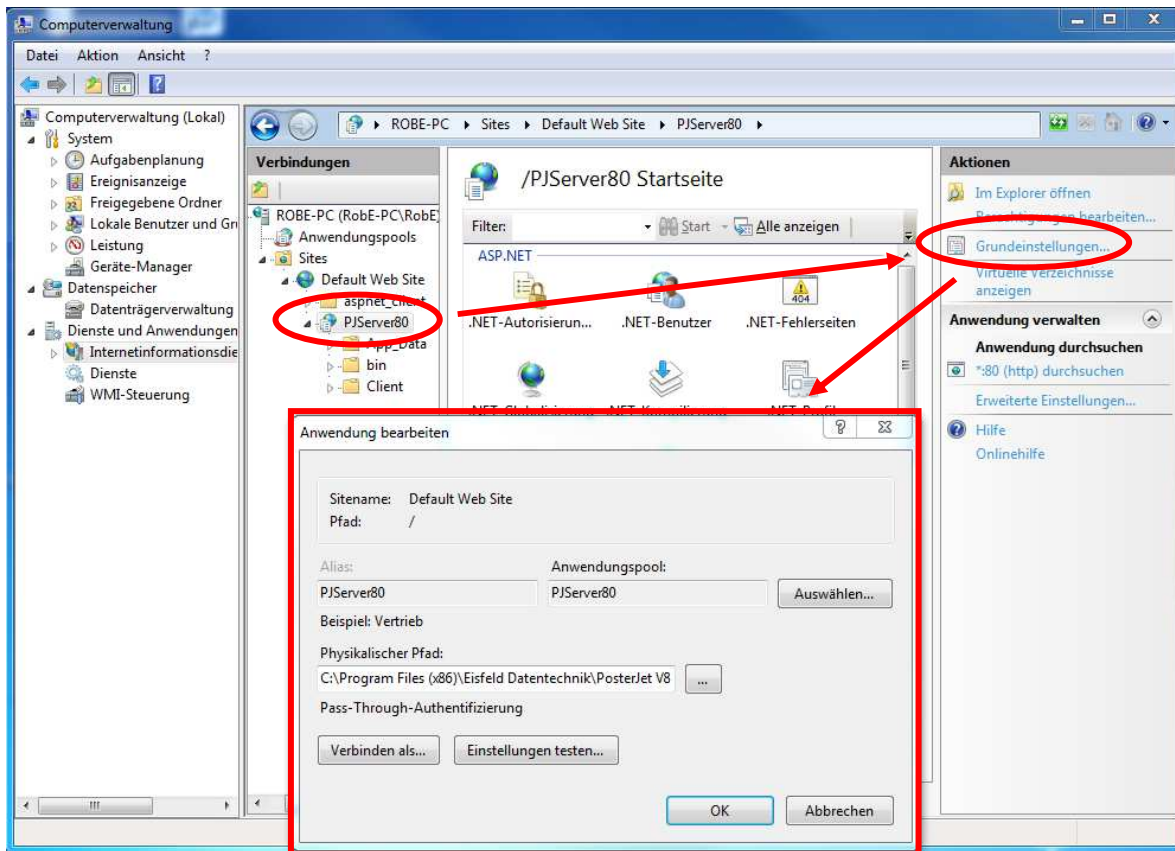

In order for the PosterJet Server to work without issues under the IIS it is important that the following parameters are set correctly. Basic settings for the “PJServer80” Application Pool.

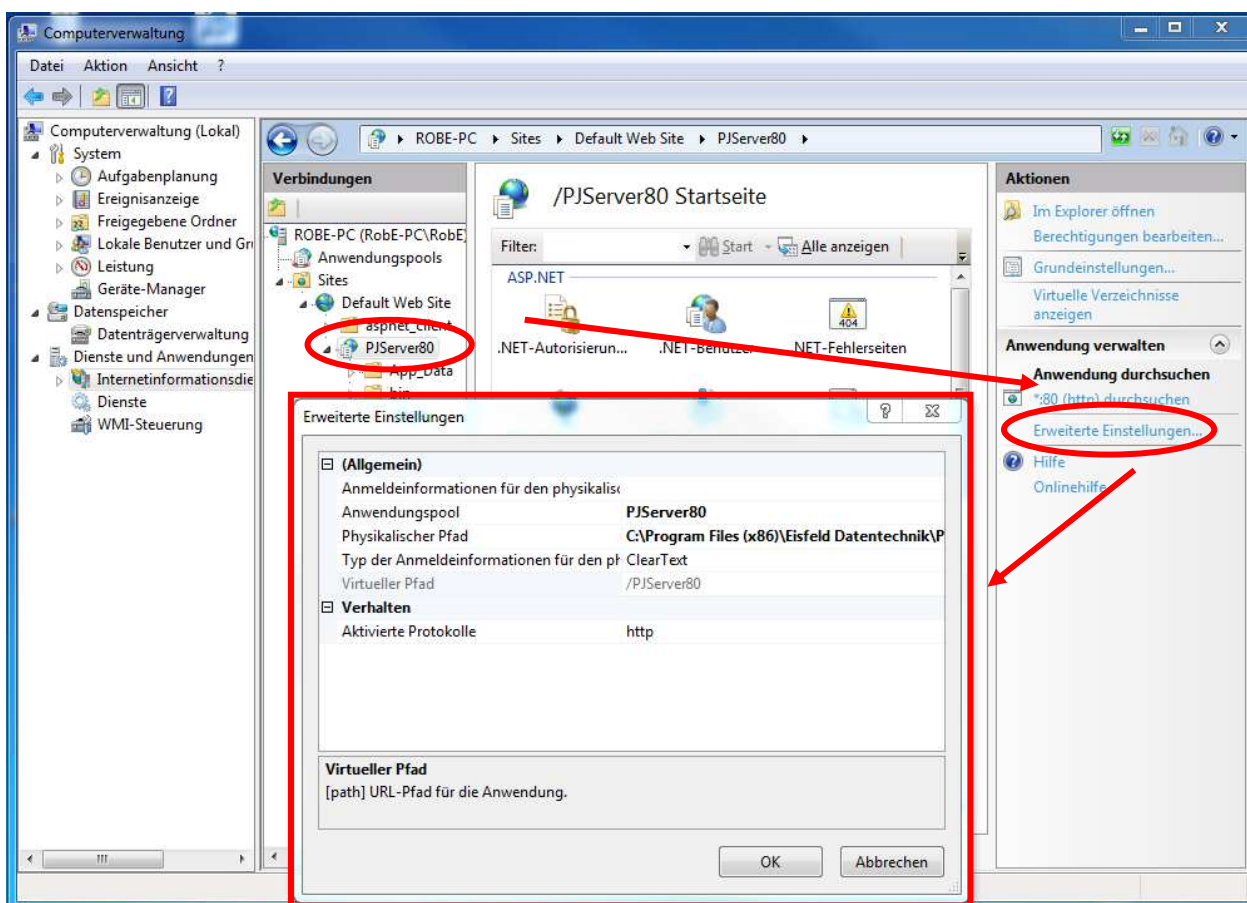

Advanced settings for the “PJServer80” Application Pool.

Basic settings for “PJServer80” Default Web Site.

Advanced settings for the “PJServer80” Default Web Site.

The following method can be used to check if the PosterJet Server was correctly installed and registered under the IIS: Open the Microsoft „Internet Explorer“ and type the following address into the address bar:

<http://localhost/PJServer80/PJServerV8.asmx>

You PosterJet Server was correctly installed and registered under the IIS if the following window appears:

Folgende Vorgänge werden unterstützt. Eine ausführliche Definition finden Sie in der [Dienstbeschreibung](#).

- [AddPrinter](#)
- [ApplyTemplate](#)
- [BidiMediaSizeOnOff](#)
- [CalibratePrinter](#)
- [CallGeneralFlagOperation](#)
- [CancelSearchPrinters](#)
- [ChangePrinter](#)
- [CheckPreviews](#)
- [ClientLogin](#)

Your PosterJet Server was incorrectly installed or registered under the IIS if the following window appears:

In such case check the parameters for the „PJServer80“ Application Pool and Default Web Site.

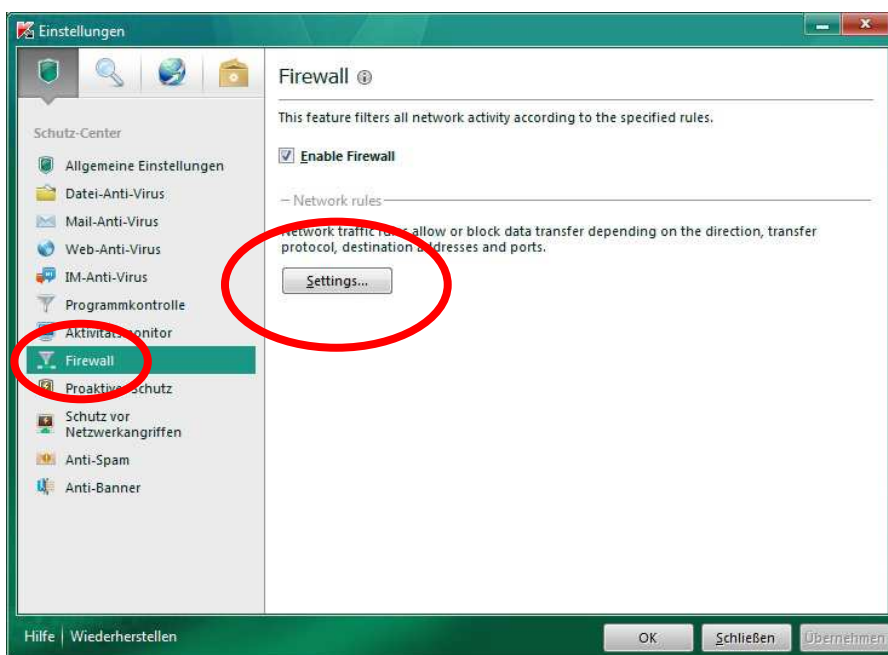

### PosterJet 8.7 and Kaspersky Internet Security Suite

In order to enable a trouble free and real time communication between PosterJet Client and PosterJet Server it is important that you follow the instructions carefully when using Kaspersky Internet Security Suite on the same computer. Using different malware protection software may require adding similar exceptions for PosterJet.

First open Kaspersky Internet Security Suite. Select “Settings” from the top menu.

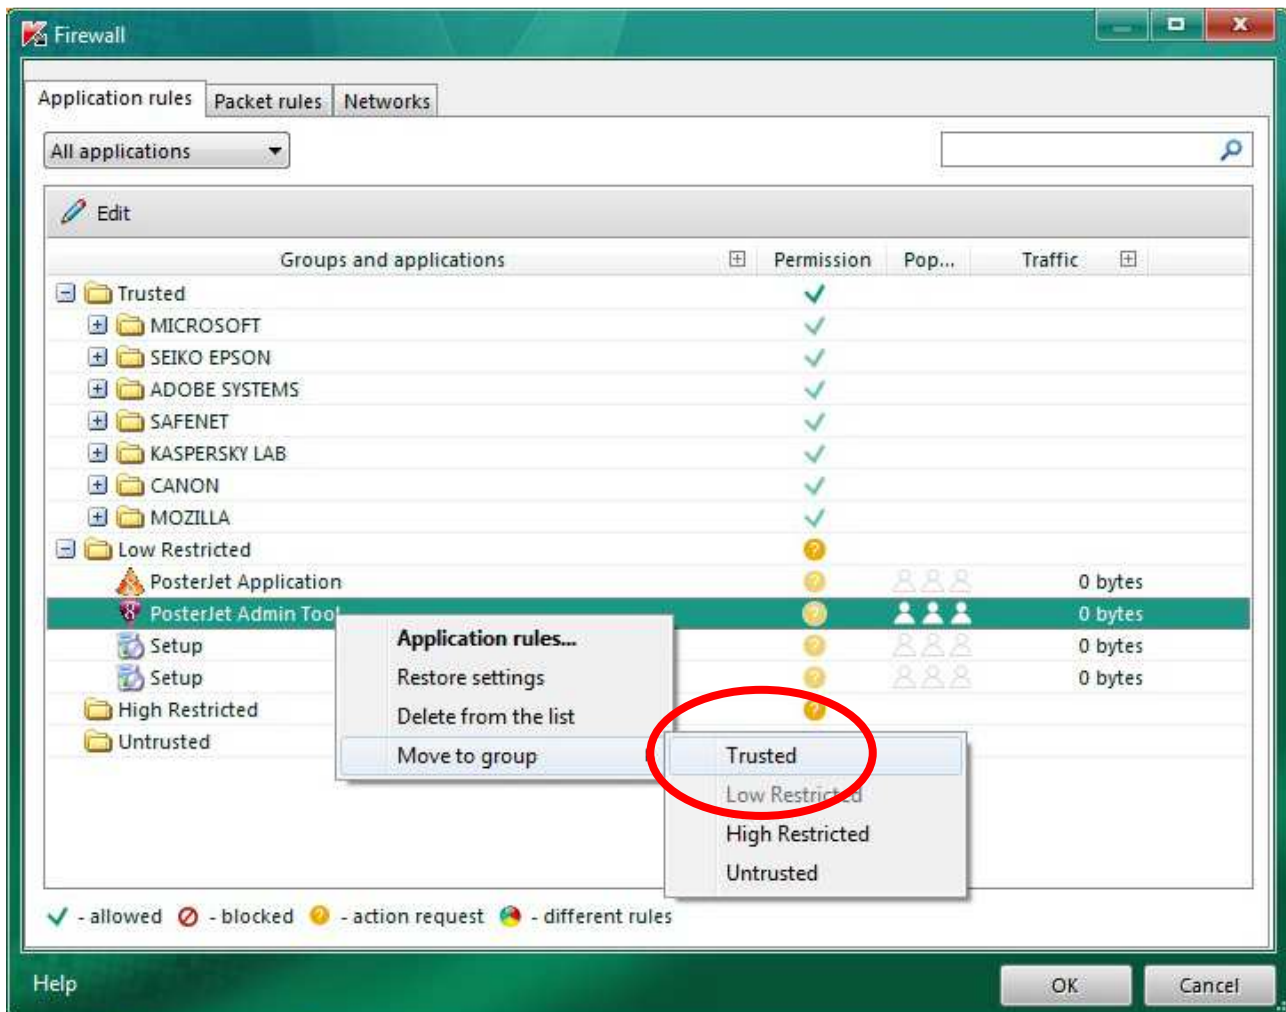

Open the **Firewall** menu and click onto the button “**Settings...**”.

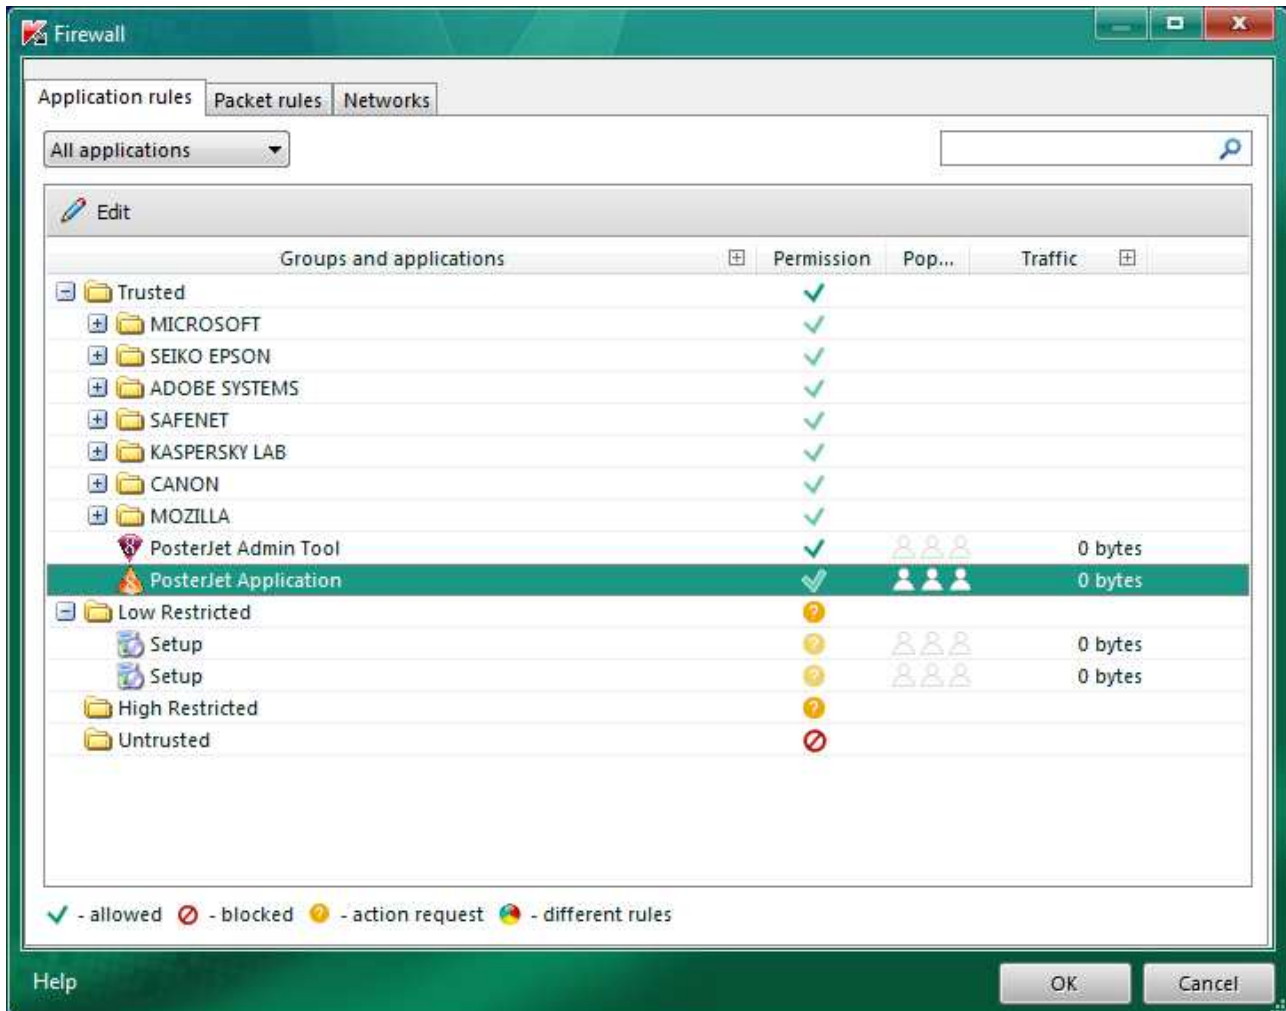

Kaspersky Internet Security Suite will place PosterJet Client and Server typically into the area of “**Low Restricted**” applications. In order to enable a trouble free communication between the PosterJet components and for reasons of performance it is required that PosterJet is added to the group of trusted programs. Here is how to change the status:

Right click on the entry **PosterJet Admin Tool** and select the menu item „**Trusted**“ from the context menu as seen in the following screenshot.

Repeat the step for the following component: **PosterJet Application (if available also eABAPI Core Process module and Canon IOS Core Module)**, so that subsequently all components can be found in the group of trusted applications.

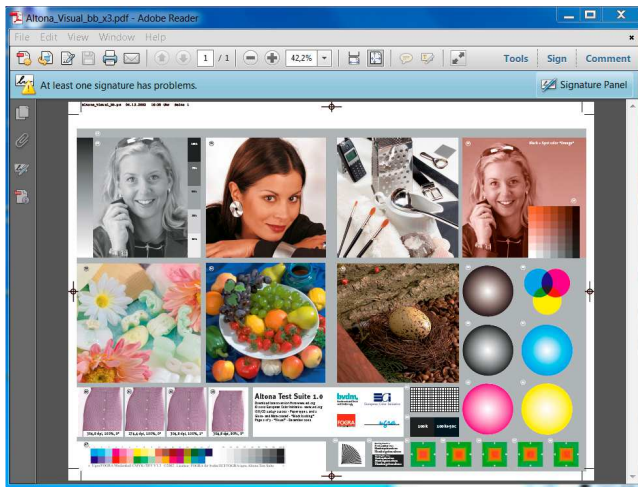

**Hint:** ensure that you add PosterJet Client and Server to the exception list when using different antivirus software in order to ensure real time communication between the components.

### Reproduction of PDF-files with overprinting elements

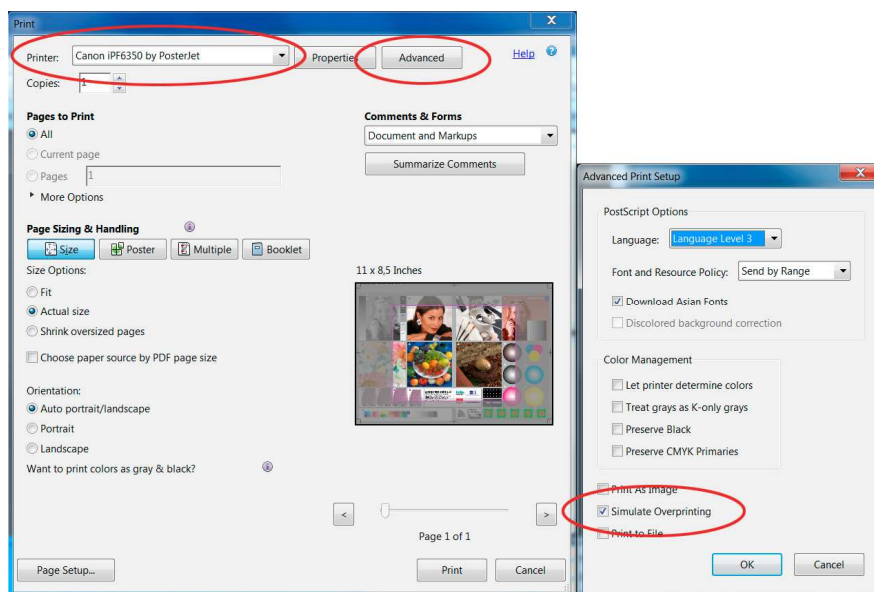

PDF files with elements set to overprint may in some cases output incorrectly. The overprint information may just be ignored by PosterJet or rendered incorrectly. In order to reproduce such documents correctly we suggest you proceed as follows.

Requirement: a virtual PosterJet printer must be installed. The installation of a virtual PosterJet printer is described in Support Guide No. 5.

- 1) Load and install Acrobat Reader X (at least in version 10.1.2).
- 2) Open the PDF file and click the print symbol.

Select the “by PosterJet” printer from the printer list. Click the „Advanced“ button and activate the option „**Simulate Overprinting**“.

Now confirm with „OK“. If required, set optional parameters under “Properties”. Click „**Print**“ to send the file directly into the PosterJet queue for processing and printing.

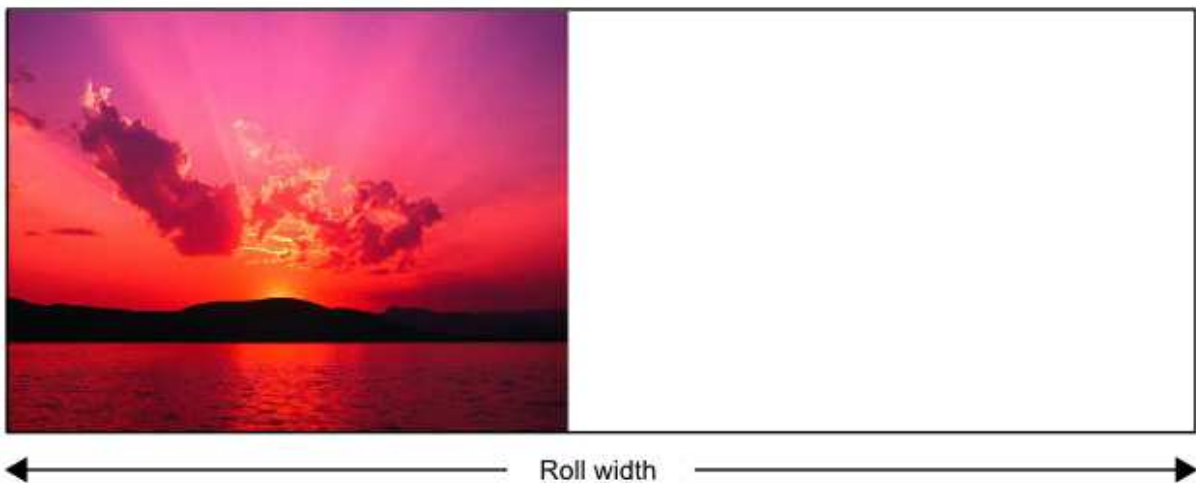

## PosterJet Tri-Side-Cut (TSC) plugins

Using the PosterJet TSC plugins will help you reduce time while trimming images to obtain borderless results. Every time you print an image that is smaller than the current roll width, you end up having borders around your print. The TSC plugins allow you to print smaller images effectively onto any roll paper, having to cut only one side in order to obtain a fully borderless output. It's necessary to understand the functionality of TSC plugins in order to avoid any errors, so please read the following explanations carefully.

### Features:

A PosterJet TSC plugin is handled as a dedicated printer in PosterJet. This means: a Canon iPF6100 plugin and the iPF6100 TSC plugin are handled the same way in PosterJet both requiring a printer license. The simultaneous use of a standard printer plugin and a TSC plugin in PosterJet requires a SimuPrint license for the "second" printer.

A TSC plugin prints at least three sides of an image borderless so that only one side must be cut manually to achieve a complete borderless print (the standard PosterJet printer plugin or even the original Canon printer driver only print borderless when the image is scaled to the full media width).

This functionality is very useful when:

- A) Printing images smaller than the current roll width and having to cut only one side to obtain a fully borderless result.
- B) Printing tiling jobs that require no trimming - completely borderless (e.g. Wallpaper printing). Using the TSC plugins you can print oversize wallpapers completely borderless with pixels matching accurately from tile to tile.

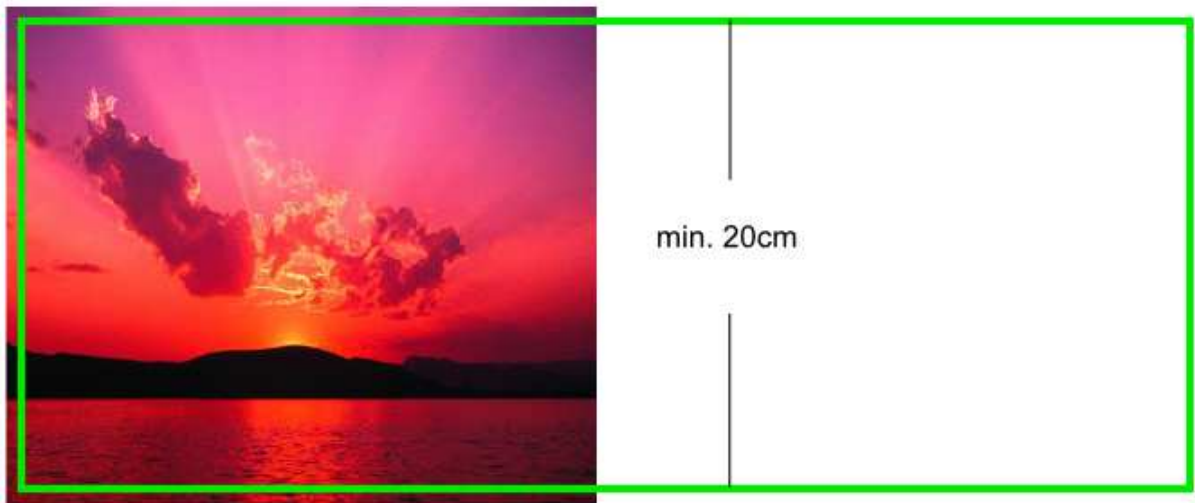

Example of borderless job using the tiling option

## Requirements for the use of Tri-Side-Cut plugins:

- A working PosterJet 8.7 installation is required.
- A TSC plugin must exist for your printer. These specialized plugins are available for a number of Canon iPF-printers only. A list with available TSC plugins can be found at the end of this document.
- Before installing the TSC plugins you must update the standard PosterJet printer plugin for the respective printer using the PosterJet "Printer and Media Update".
- When printing single images (no tiling jobs) PosterJet will automatically add 3mm to the sides overlapping the paper so that you always obtain an output in the size provided (e.g. you set the output size to 10" x 15" and you obtain a borderless print in the size of 10" x 15").
- TSC plugins use media profiles of their own which are not compatible to the profiles of standard printer plugins. The media profiles of the standard plugins are not compatible to the TSC plugins either. Media profiles for all printers are available through the PosterJet "Printer and Media Update" utility from within the Client interface.

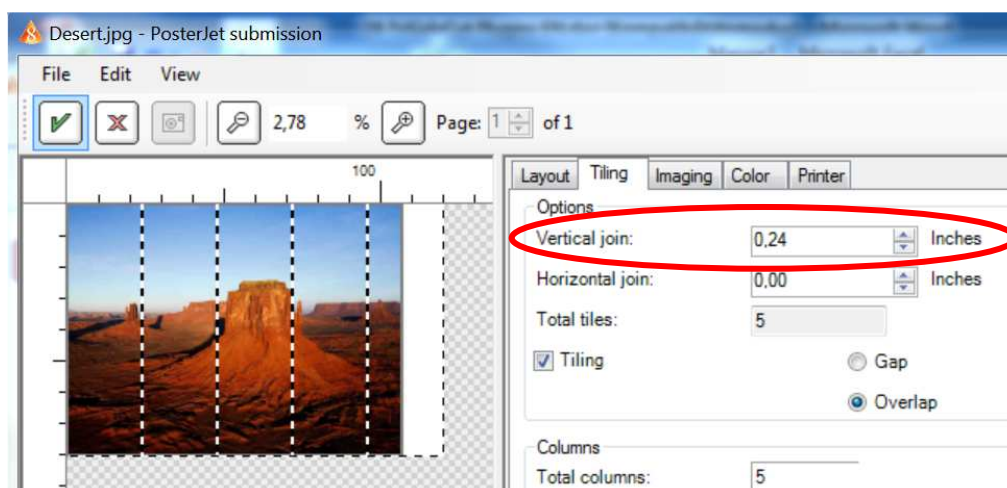

- Jobs to be printed with the TSC plugin must have a height of minimum 20 cm (or 7.9 inches) to successfully print borderless on 3 sides. This minimum length is part of a setting in the Canon iPF-printer and cannot be changed.

- The roll width must match the specifications for borderless printing on the respective Canon printer. Canon iPF-printers do not allow borderless printing on any roll width, but just on a few specified sizes. The roll width must not differ even slightly from the specified width. Printing onto a roll that is not approved for borderless printing will lead to a print with standard borders.

**Further limitation:** borderless printing onto a 60 inch roll with a 60 inch Canon iPF printer is - by default - not possible.

- Do not activate the check box "Borderless printing" within the PosterJet job submission window when using the TSC plugin. The option is set automatically by PosterJet.
- The tiles of a borderless tiling print job will perfectly fit to one another other if you add an overlap of 6mm or 0.24 inches to "Vertical join" (option inside "Tiling" tab of the PosterJet job submission window).

**TriSideCut plugins are available for the following printers only:**

- Canon iPF6100
- Canon iPF6300
- Canon iPF6350
- Canon iPF6400
- Canon iPF6450
- Canon iPF6400s
- Canon iPF8000
- Canon iPF8000s
- Canon iPF8100
- Canon iPF8100s
- Canon iPF8300
- Canon iPF8300s
- Canon iPF8400
- Canon iPF8400s
- Canon iPF9100
- Canon iPF9400

## Profile creation with Canon SU-21 Spectrophotometer

### A) Creating a Custom Media using Media Configuration Tool®

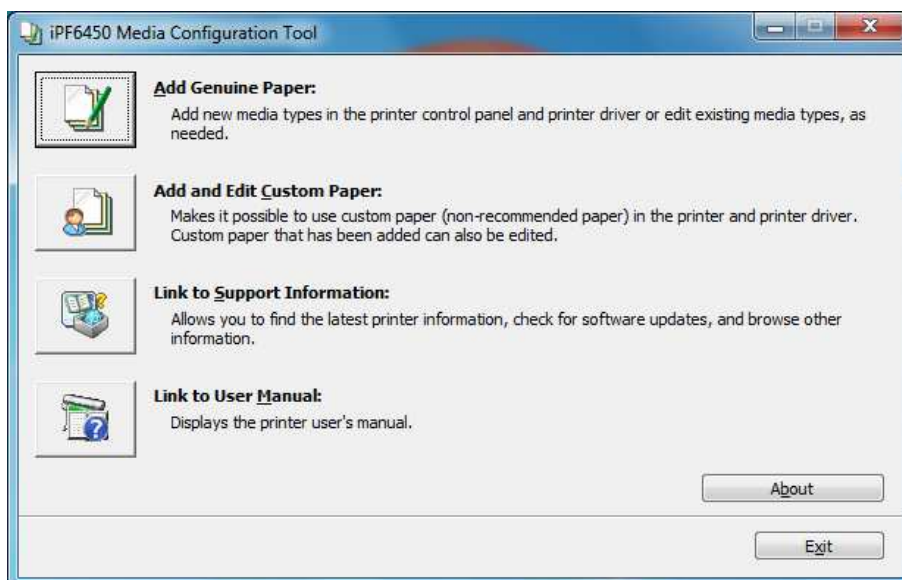

For the creation of PosterJet media profiles the user can either choose standard (available in printer) or custom media settings (to be created by user) on the printer front panel of the Canon iPF-printer.

Section A describes how custom media settings (mostly for 3<sup>rd</sup> party media where standard settings do not deliver a satisfying result) can be created for one of the new Canon 12 color iPF-printer (x400-series) and also be transferred to another iPF-printer of that same series. The Media Configuration Tool® enables the creation, administration and transfer of custom media profiles on compatible Canon printers. The following printers allow the exchange of PosterJet media profiles by granting identical results on any of the listed printers:

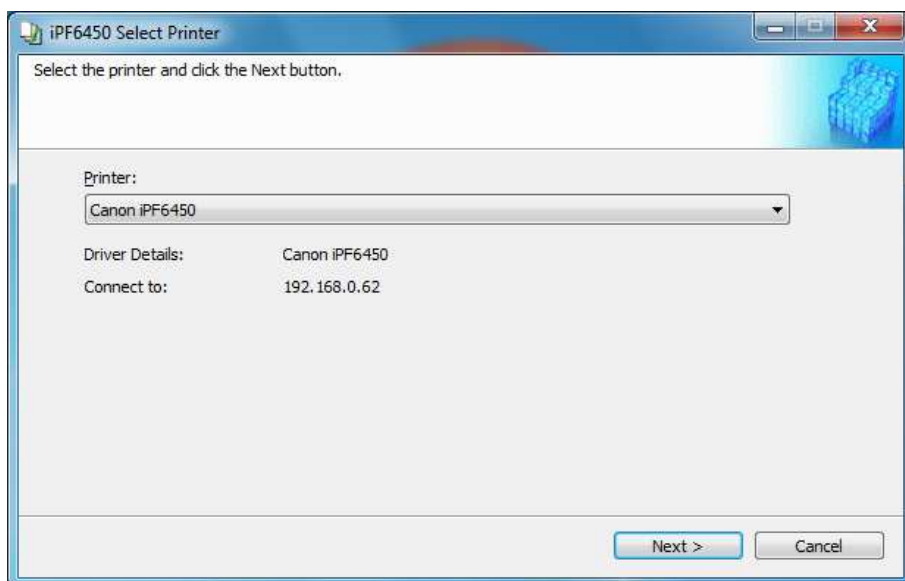

iPF6400 / iPF6410 / iPF6450 / iPF6460  
iPF8400 / iPF8410  
iPF9400 / iPF9410

Proceed as follows:

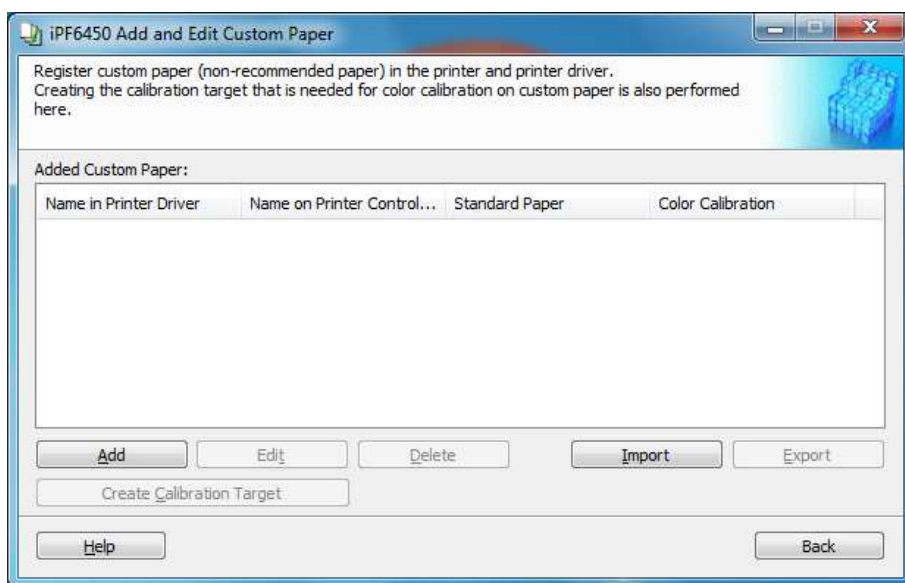

After the installation of the Media Configuration Tool® open the program via the windows start menu or the desktop shortcut.

Choose the option „Add and Edit Custom Paper“.

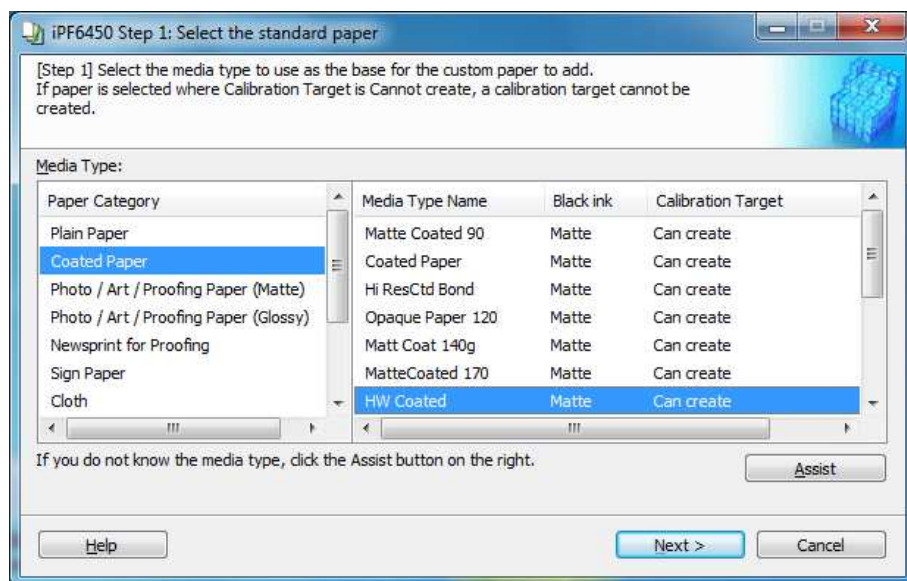

Choose a Printer from the dropdown menu and click „Next“.

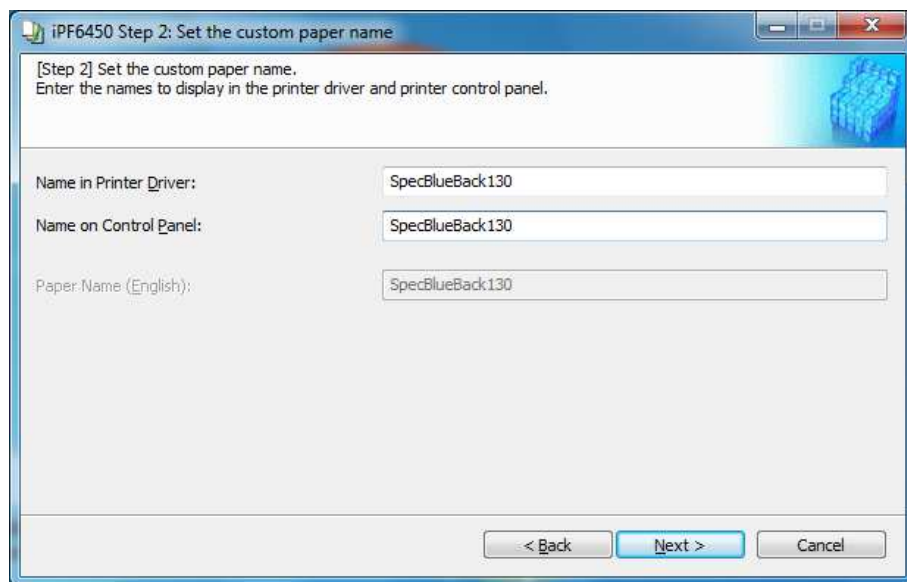

Now you can either add or import an existing custom media profile. To add a custom media click now on „Add“.

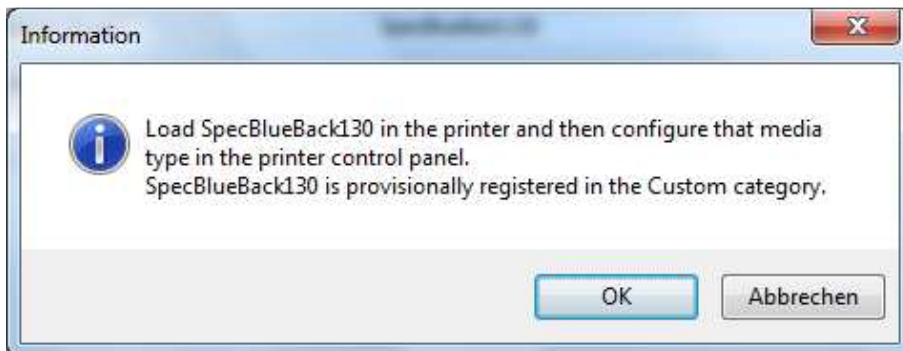

Adding of a custom media types is subdivided into several steps:

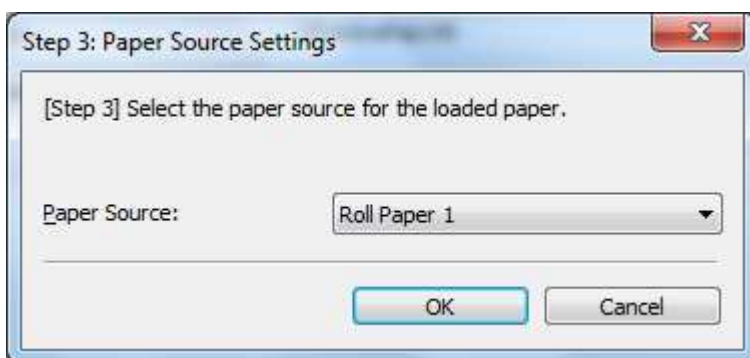

Step 1: Choose the media type and the media type name and click on „Next“.

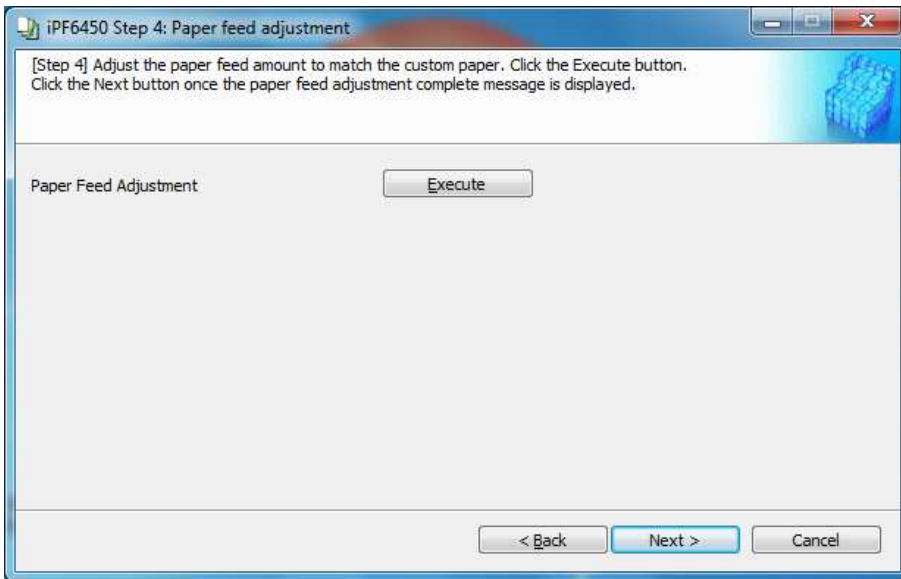

Step 2: Set the name of the custom media and click on „Next“. Please note that the maximum length of the name is limited to 16 characters. If more than 16 characters are entered, a warning message will appear.

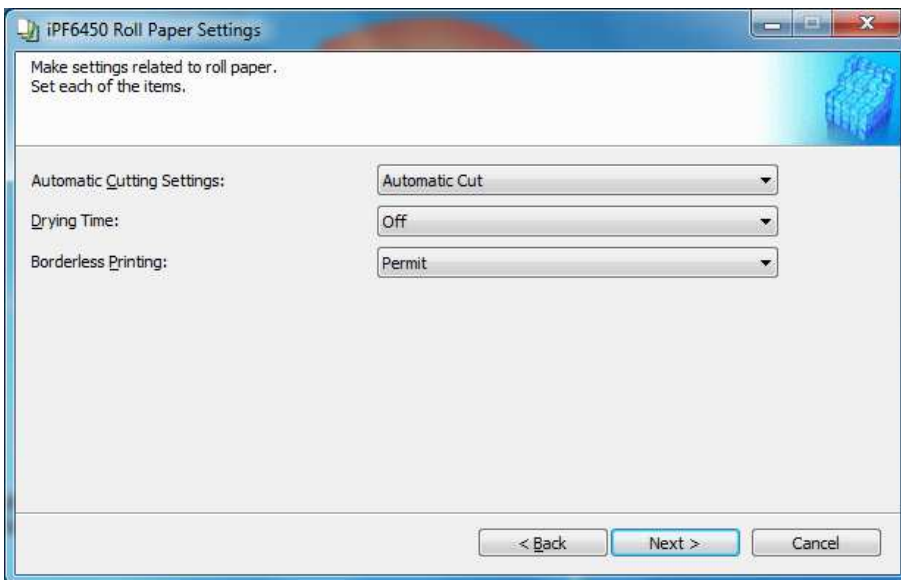

Load the roll paper and choose the category „Custom“ in the printer front panel where you will find the newly created media type. Proceed with „OK“.

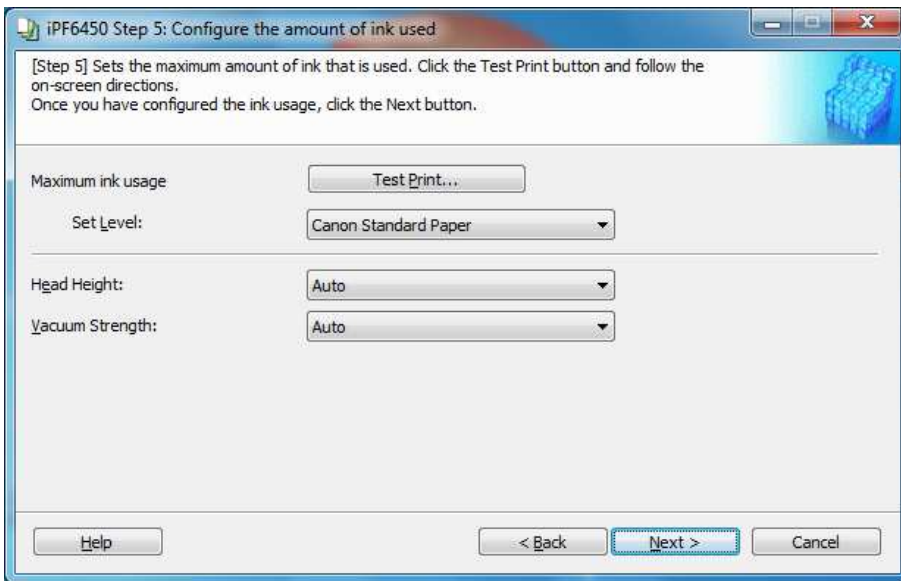

Step 3: Choose the paper source and click on „OK“.

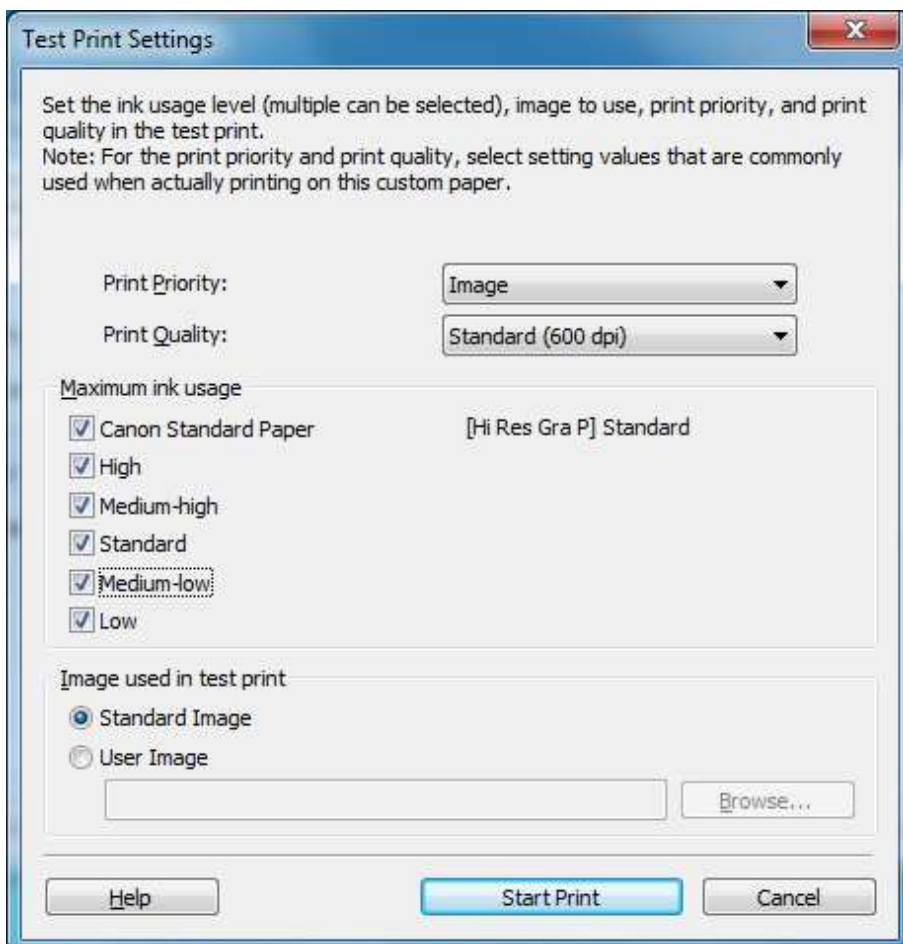

Step 4: If required the paper feed adjustment can automatically be executed. If you want to skip this step click directly on „Next“.

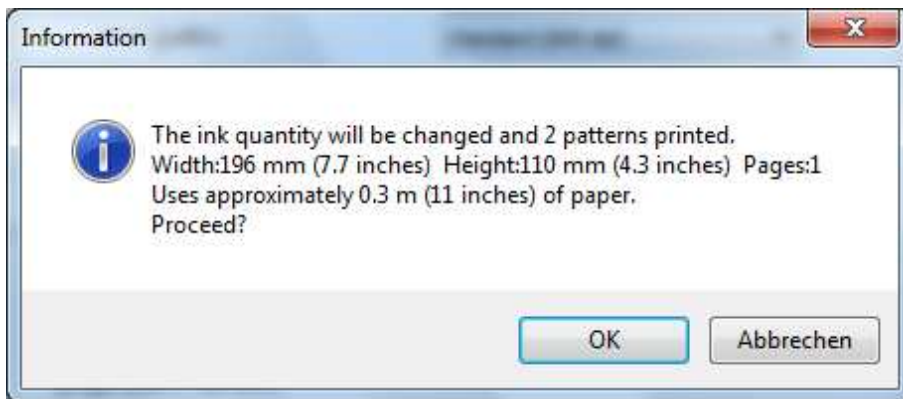

Choose the roll paper settings and confirm with „Next“.

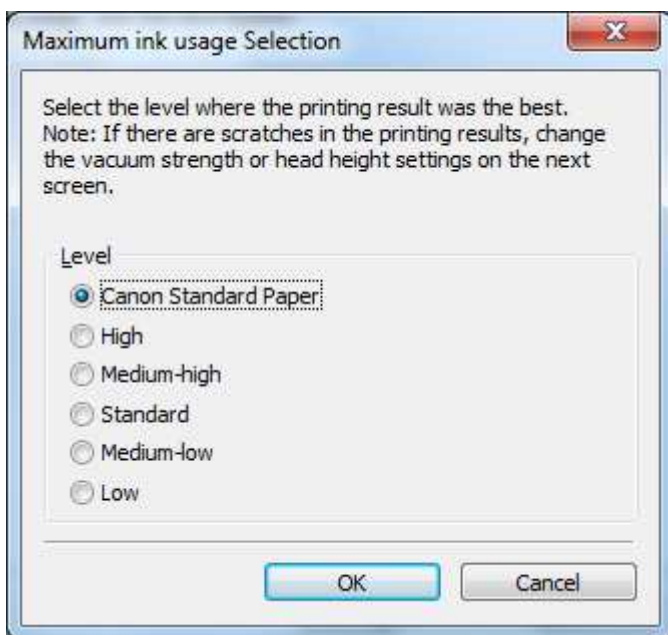

Step 5: If required the amount of ink usage, the printer head height and the vacuum strength can now be configured. If you want to skip this step click directly on „Next“.

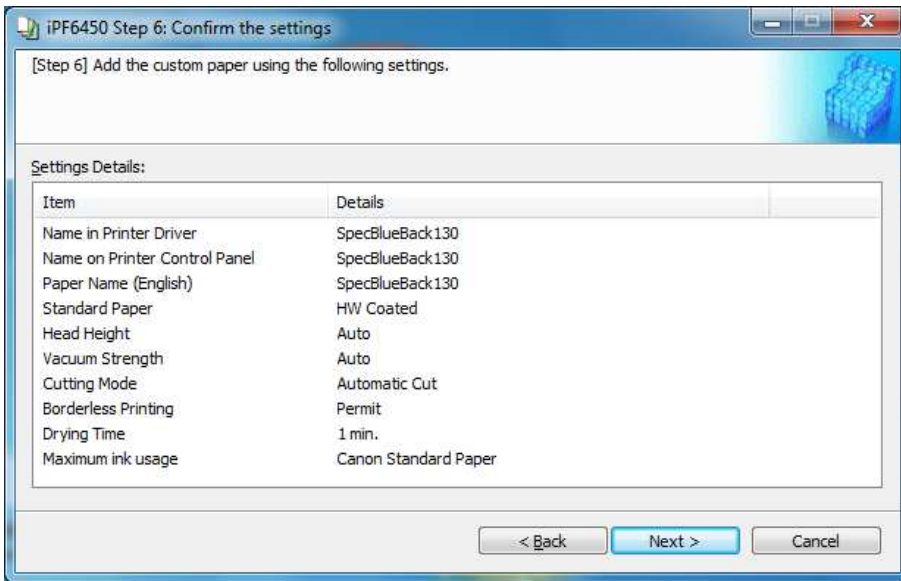

Select the necessary options (see screenshot above) and click „Start Print“.

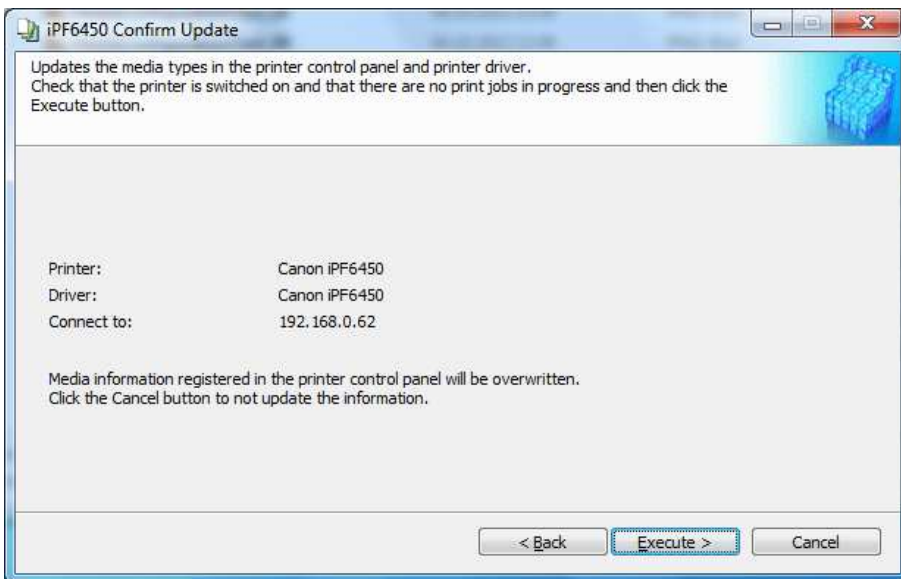

An information window with the selected settings pops up. Start printing by clicking on „OK“.

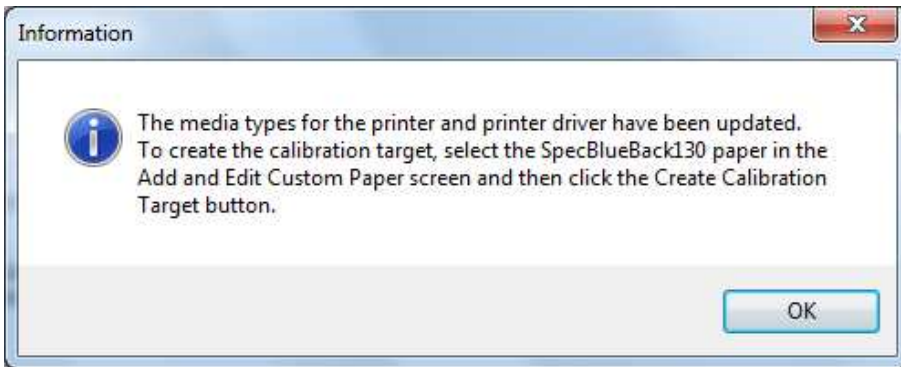

After an appropriate drying time check the printed paper and choose the test field with the best print result. Choose the corresponding setting in the open window and confirm with „OK“.

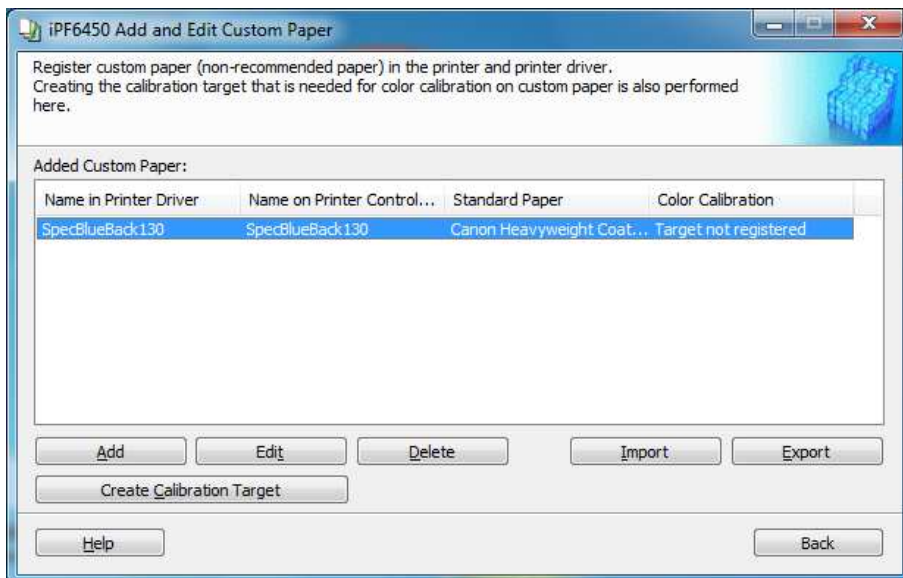

Step 6: Confirm the settings for the custom media and click on „Next“.

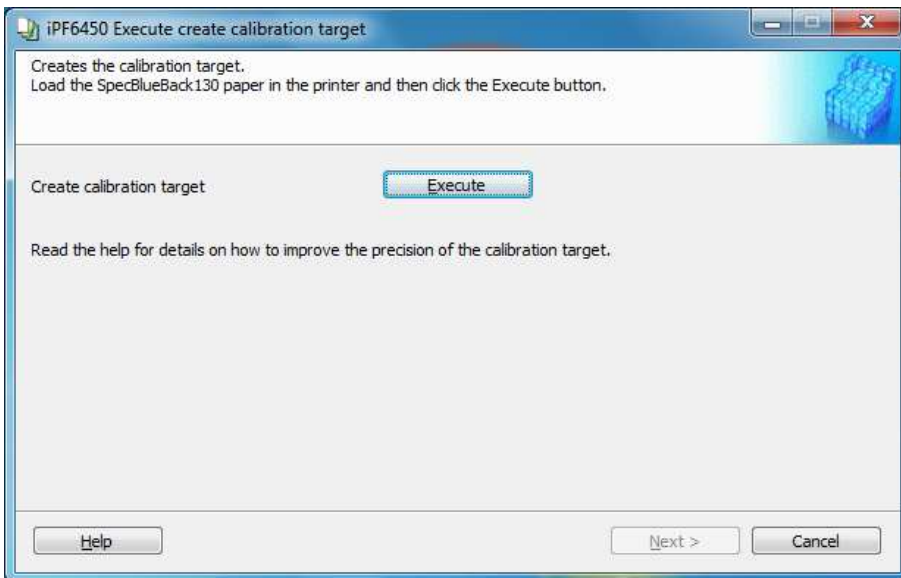

Now confirm the update of the printer control panel and the printer driver. Click on „Execute“.

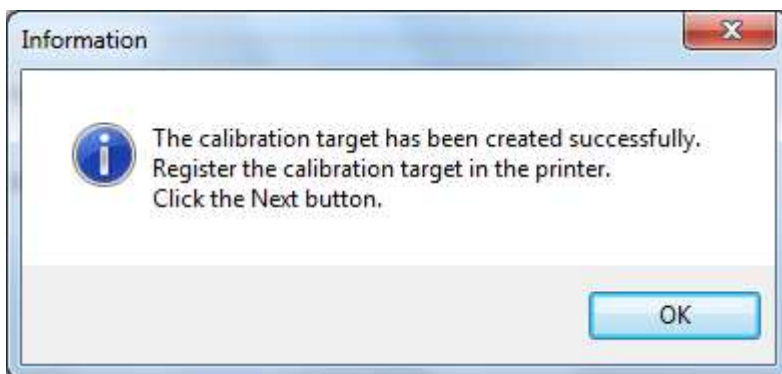

After the update you will be informed about the possibility to create a calibration target. Click on „OK“.

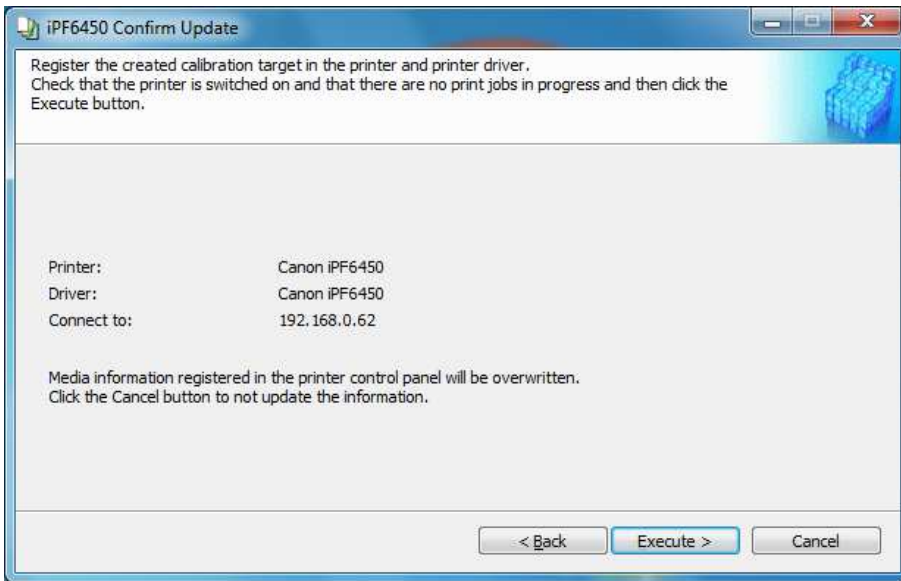

Now, in the custom media overview the newly added media will be displayed. Finally, you should create a calibration target for your custom media (not available for all media types) by clicking „Create Calibration Target“.

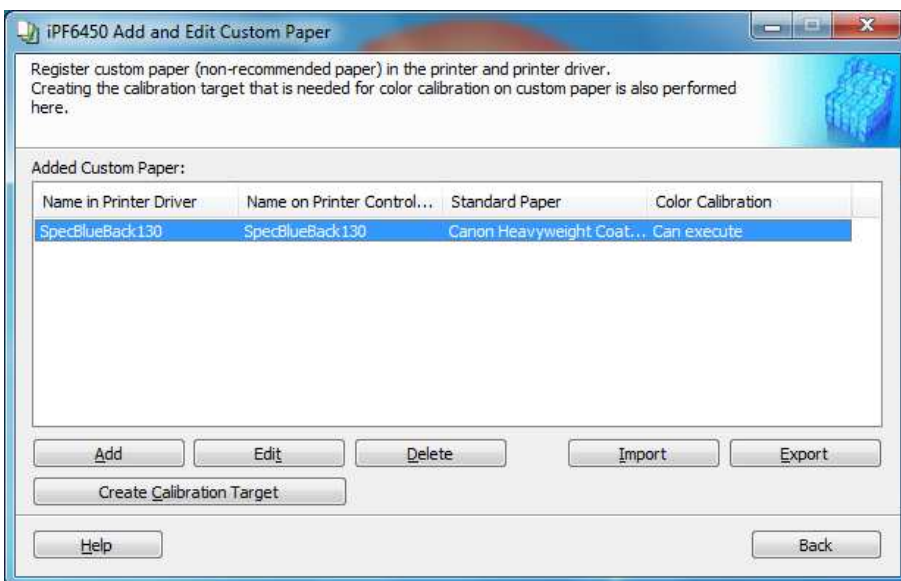

Confirm that you wish to create a calibration target and click „Execute“

After the paper feed adjustment is executed automatically the calibration target will be created. In the end an information window pops up. Now click „OK“.

Apply the registration of the calibration target in the printer and the printer driver.  
Click on „Execute“.

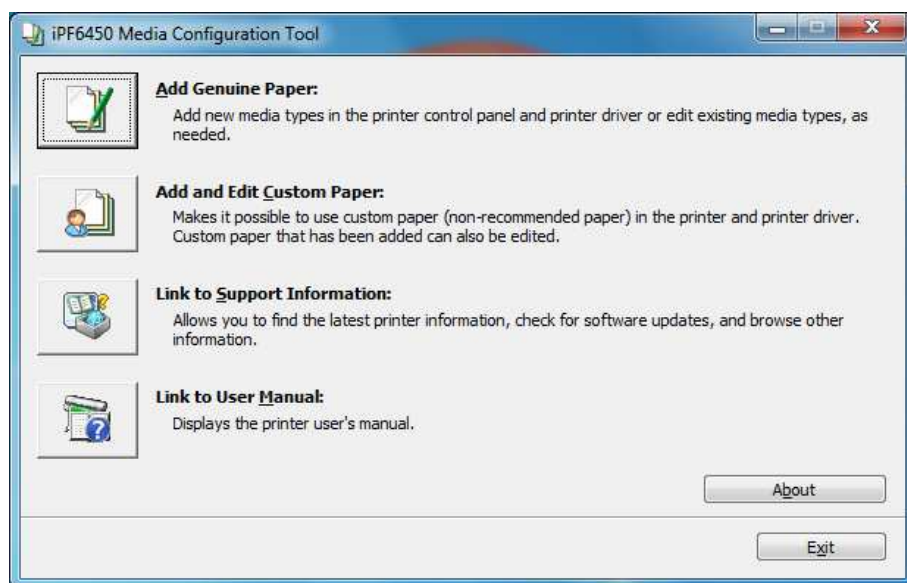

After the calibration target has successfully been created you can export the custom media profile (including the calibration target).

### B) Export Calibration Target using Media Configuration Tool®

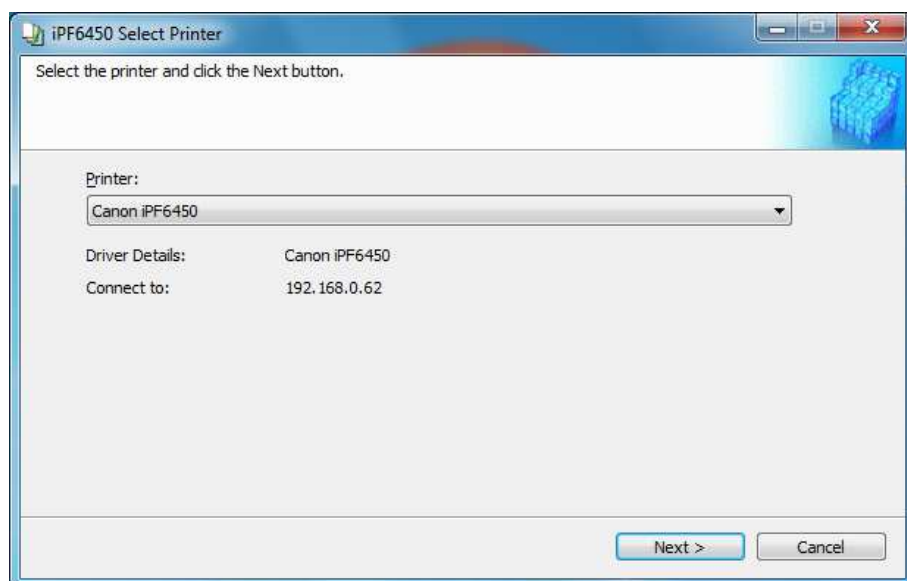

This section describes how an existing calibration target can be exported to a compatible printer, using Media Configuration Tool®.

Proceed as follows:

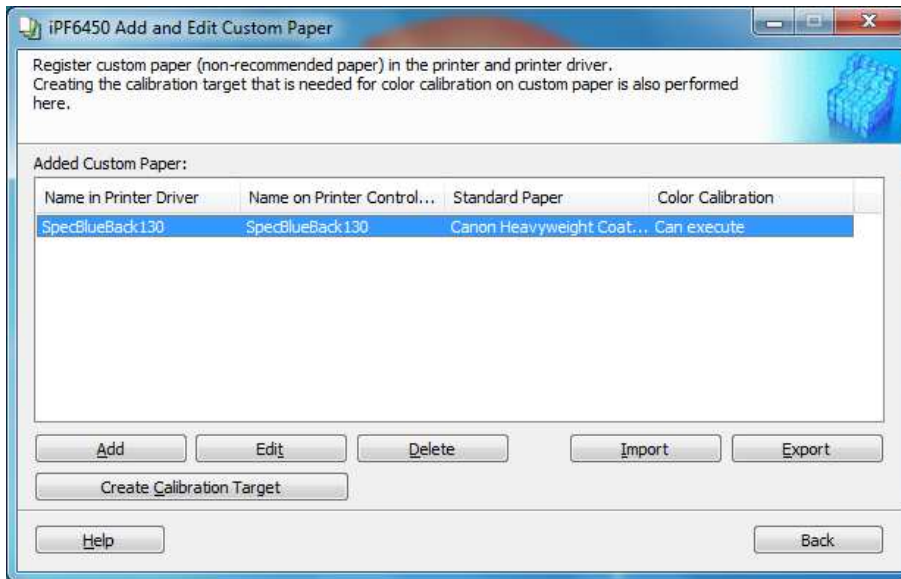

If you have already installed Media Configuration Tool open the application via the windows start menu or the desktop shortcut.

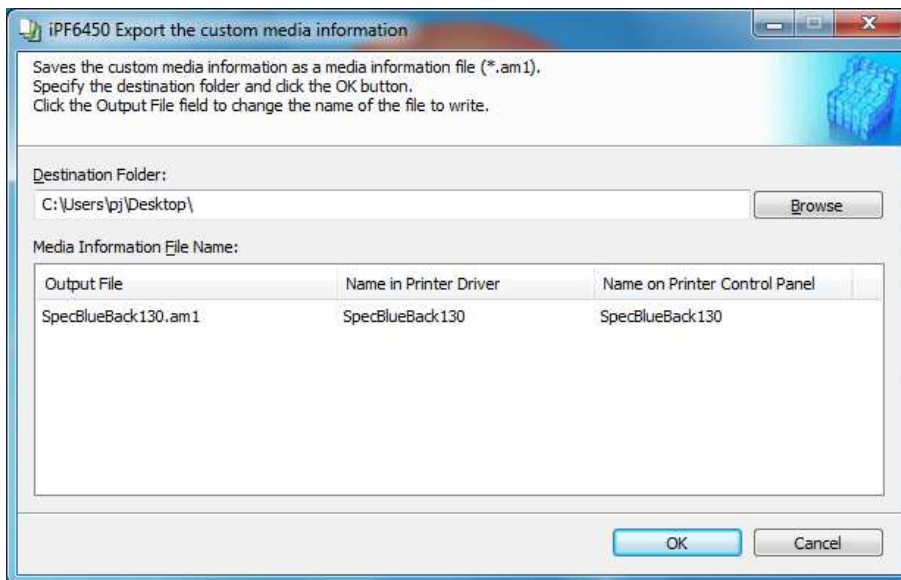

Choose the option „Add and Edit Custom Paper“.

Choose a printer from the dropdown menu and click „Next“.

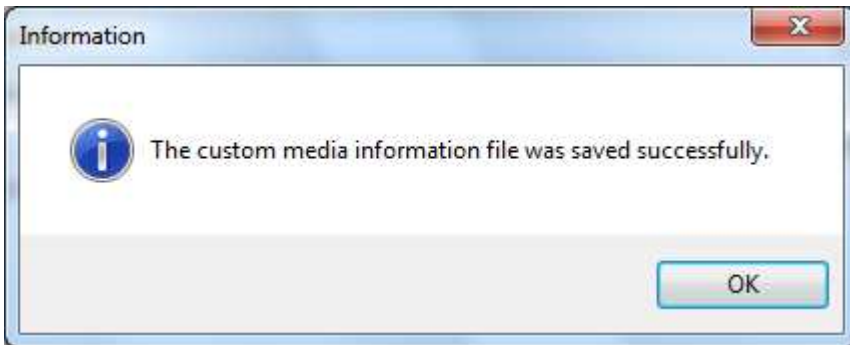

Choose your custom media and click „Export“.

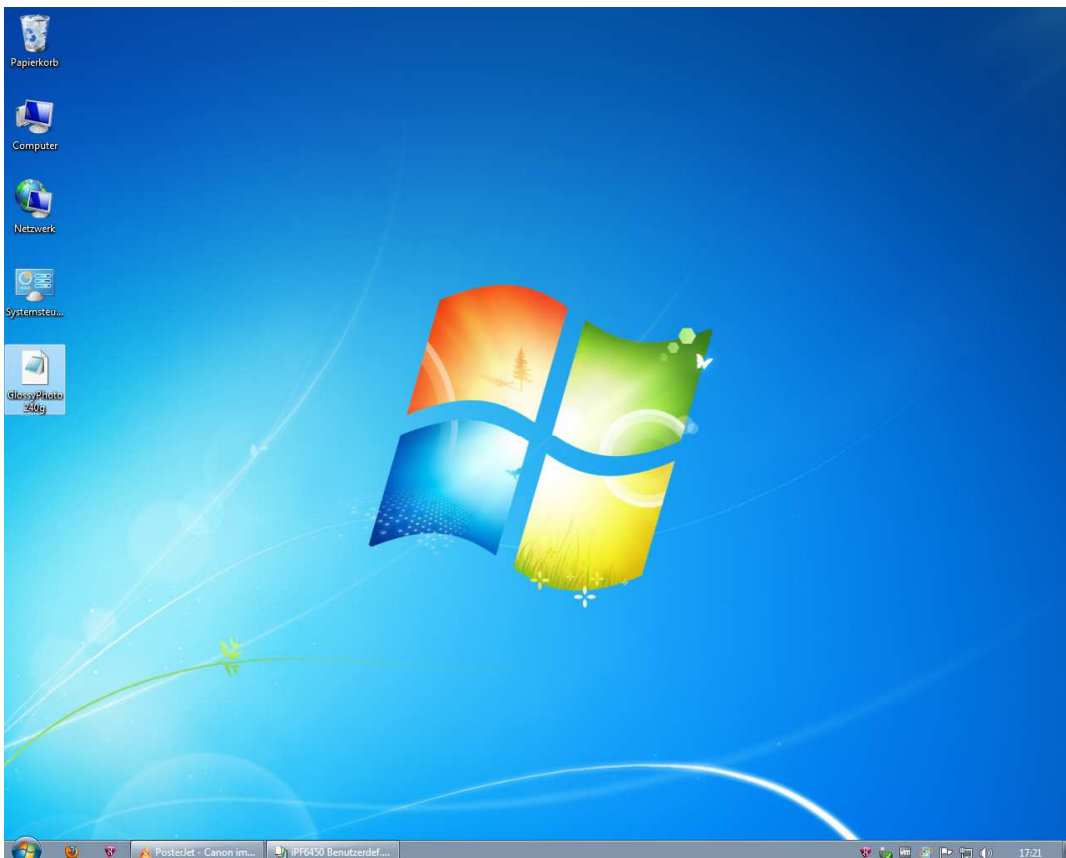

Now you can export the custom media information as a media information file (\*.am1).

To do so, please choose a destination folder and click „OK“.

After the \*.am1 file has successfully been saved a confirmation window appears. Click „OK“ once again to finalize the export. The \*.am1 file can now be selected and imported to another iPF-printer (x400-series).

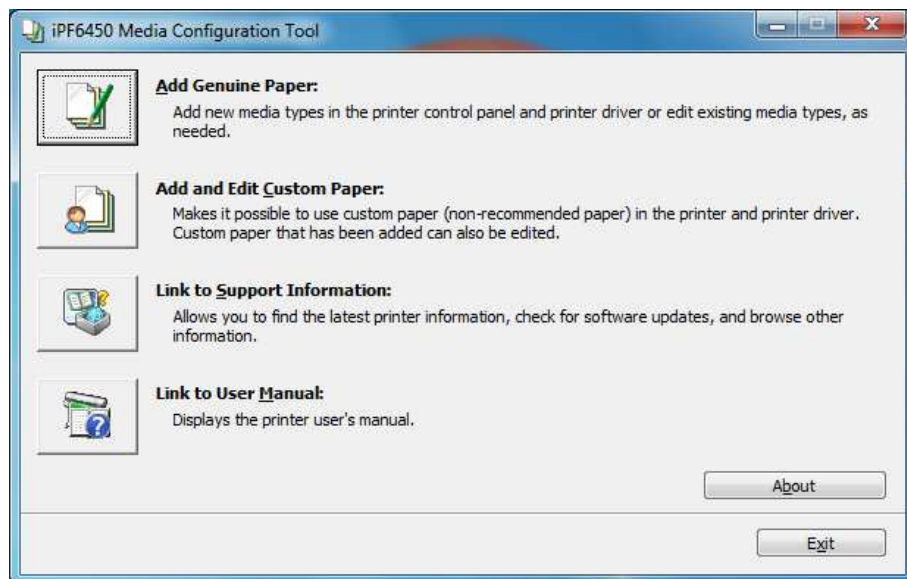

### C) Import Calibration Target Using Media Configuration Tool®

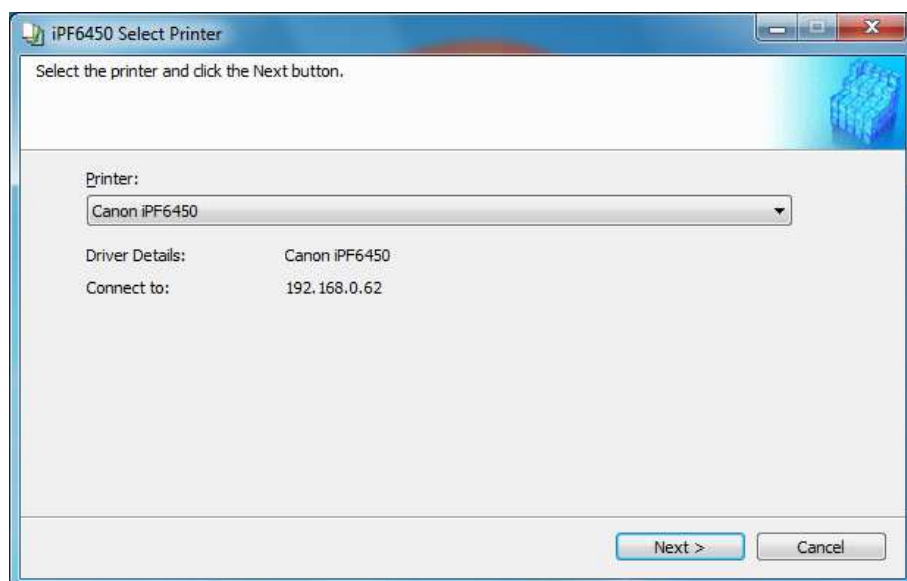

This section describes how a custom media profile can be imported into a compatible iPF-printer using the Media Configuration Tool®.

Proceed as follows:

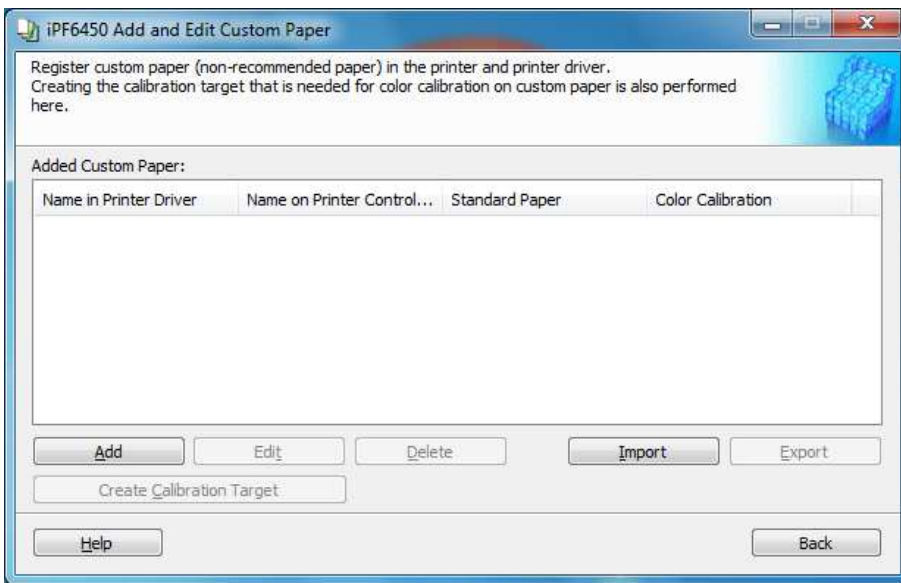

Run the Media Configuration Tool®.

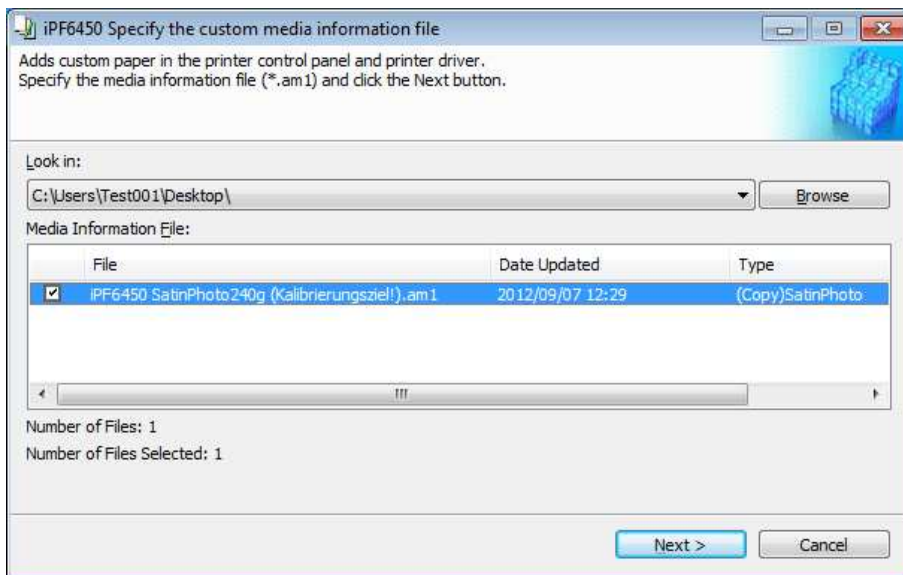

Choose the option „Add and Edit Custom Paper“.

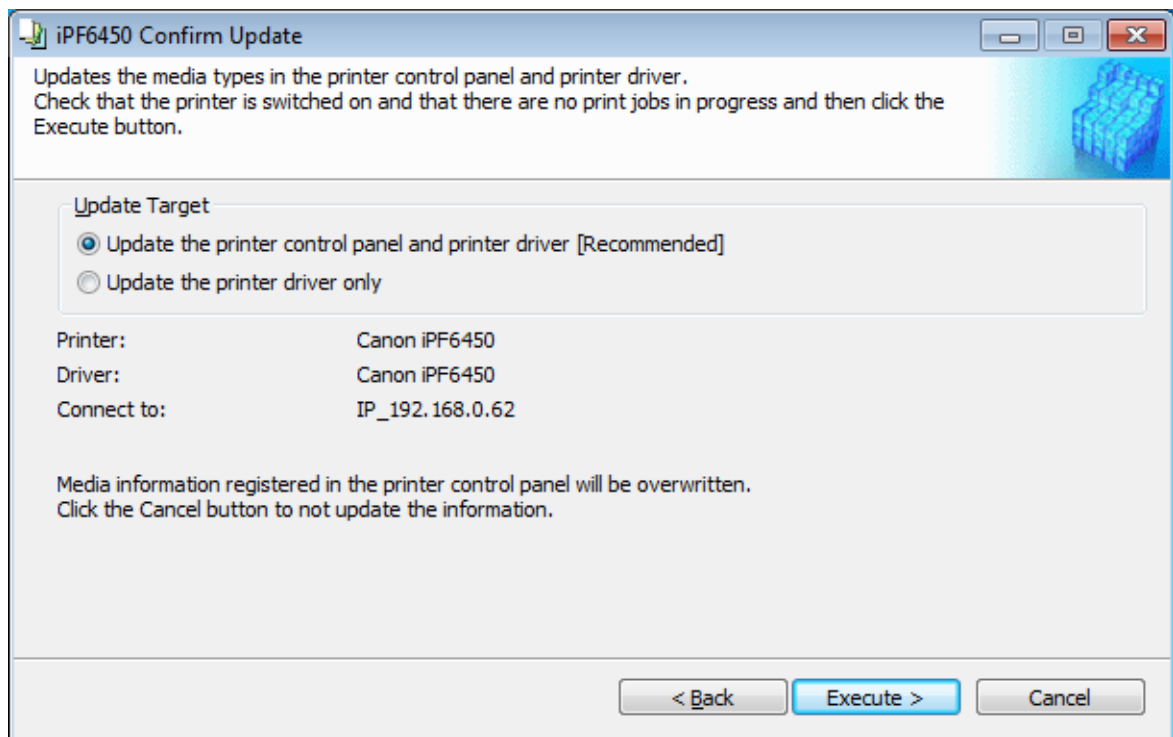

Choose a printer and click „Next“.

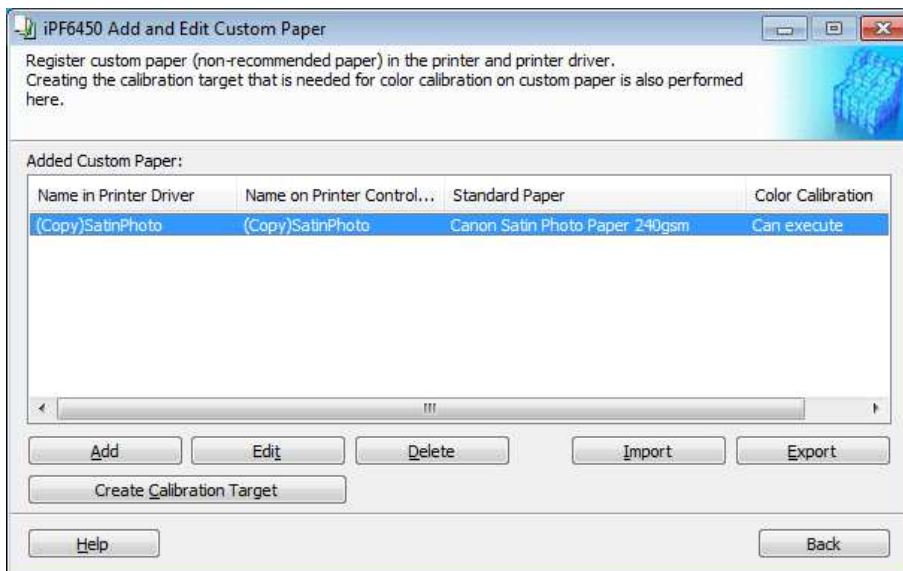

To import a custom media click the „Import“ button. **Please note:** in the following example we chose a different media for export than the one in the previous chapters (SatinPhoto240g instead of SpecBlueBack130).

Choose the media information file (\*.am1). Next to the file name, the date and media type is shown in the window. Just click „Next“.

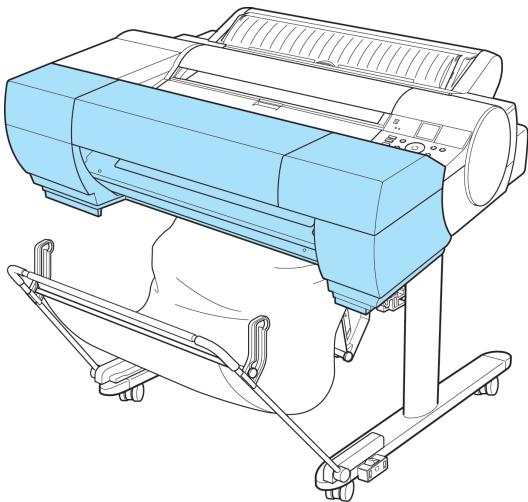

Choose a target for the update and click „Execute“.

Once the custom media has successfully been imported it will show up in the Add and Edit Custom Paper window.

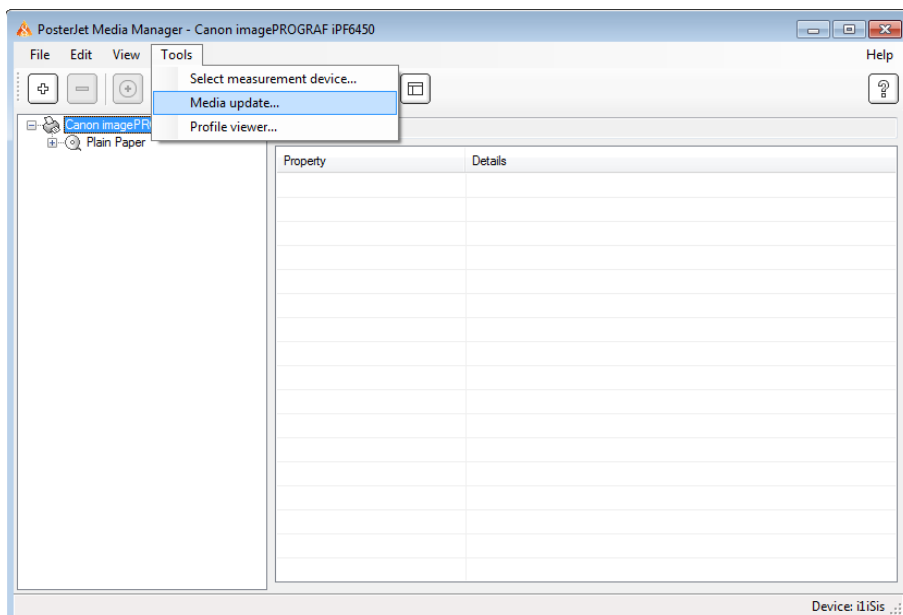

## D) Create a PosterJet Media Profile based on a Standard Media Type using Canon SU-21 Spectrophotometer.

Using the Canon iPF6450 in combination with SU-21 spectrophotometer enables the user to create color profiles for any media. Note that the SU-21 spectrophotometer is only available as an option.

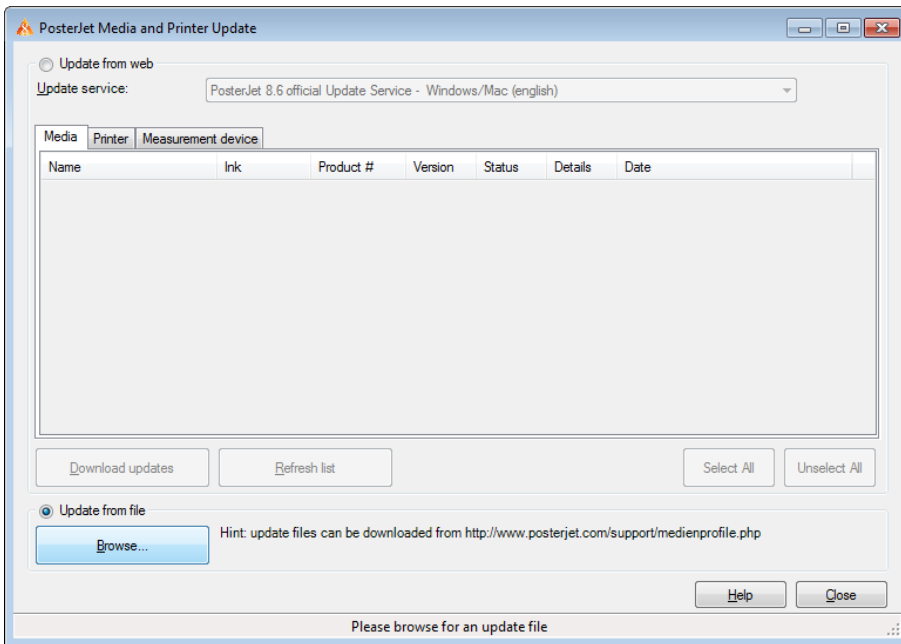

Proceed as follows:

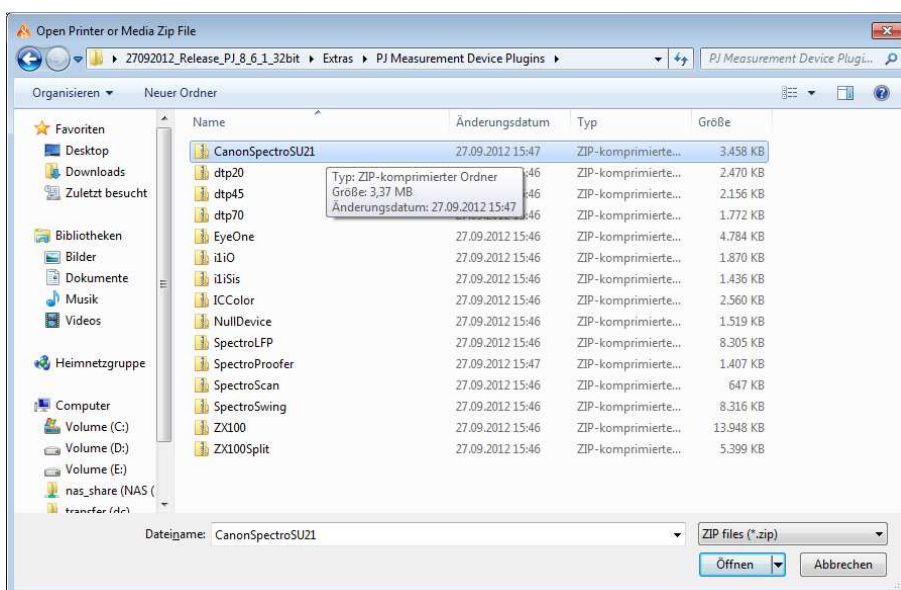

First install a measurement device plug-in in PosterJet by opening the PosterJet Media Manager.

Select „Media update...” from the “Tools” menu. If you have no internet connection, please proceed as follows, otherwise select the PosterJet 8.6.1 official Update Service to download and automatically install the SU-21 measurement plug-in.

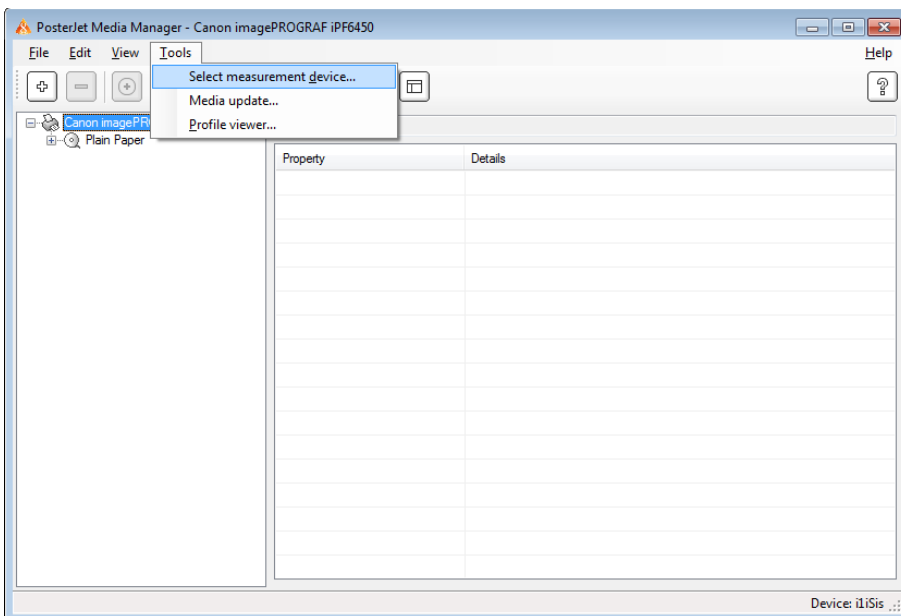

Select the radio button „Update from file“ (when Update Service is not available) and click „Browse“.

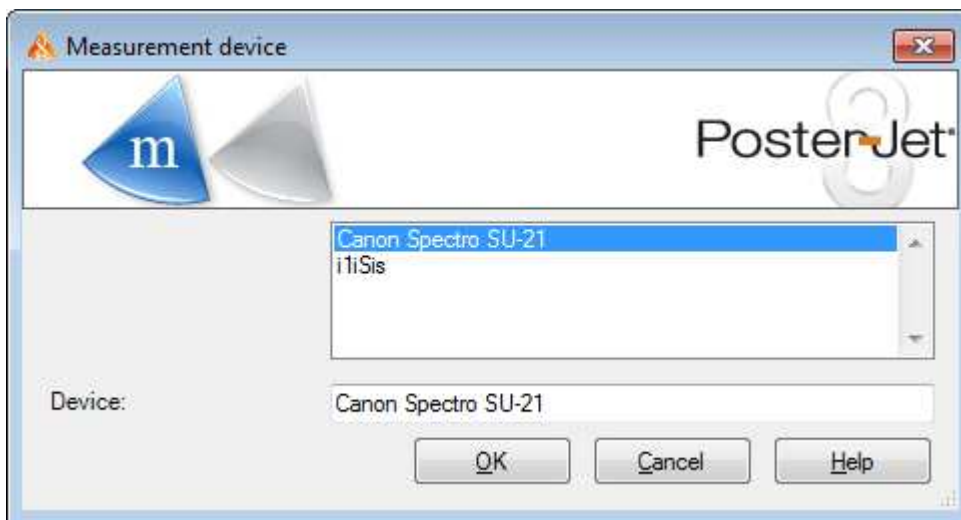

The plug-in for the Canon SU-21 spectrophotometer is located in the following folder on your PosterJet Installation-DVD:

\\Extras\PJ Measurement Device Plugins\CanonSpectroSU21.zip

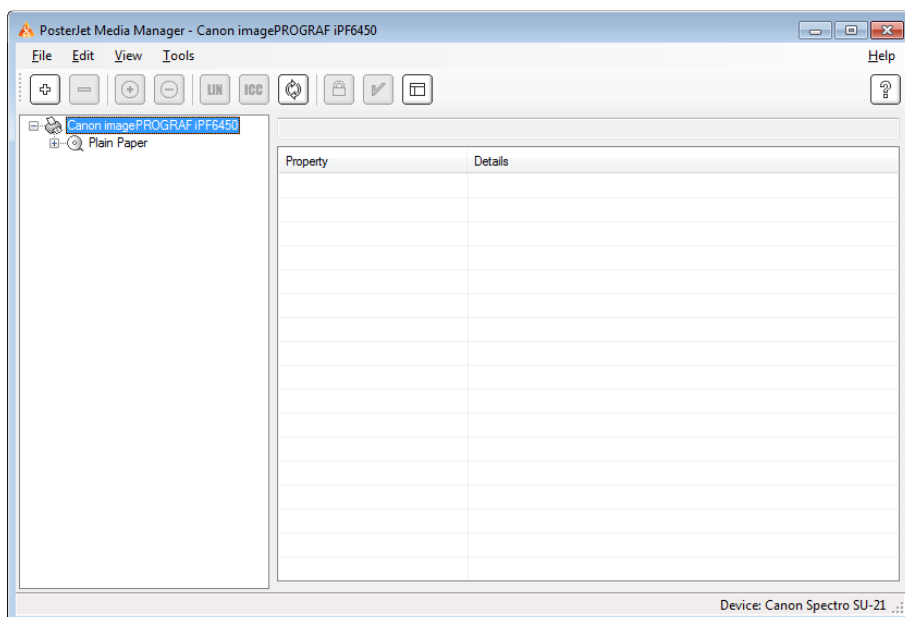

Choose this file and click „Open“. After the installation of the plug-in software the active window can be closed.

Now select the option “Select measurement device...” from the „Tools“ menu.

After the plug-in has successfully been installed the corresponding device should appear in the overview (as above). Choose „Canon Spectro SU-21“ and click on „OK“.

The selected measurement device is now shown in the lower right corner of Media Manager window.

To profile of a standard media load the roll paper in the printer as described in the printer manual and choose the corresponding media type from the printer front panel (console).

To create a color profile, please follow the instructions in Support Guide No. 13.

Please note that PosterJet controls the printing and measurement process automatically so you only have to click „Next“ at all time in the Profiling Wizard.

**Important: creation of new media profiles in PosterJet is only available with active “Linearization” or “Profiling” module in PosterJet!**

### E) Create a PosterJet Media Profile based on custom media type settings using Canon SU-21 Spectrophotometer

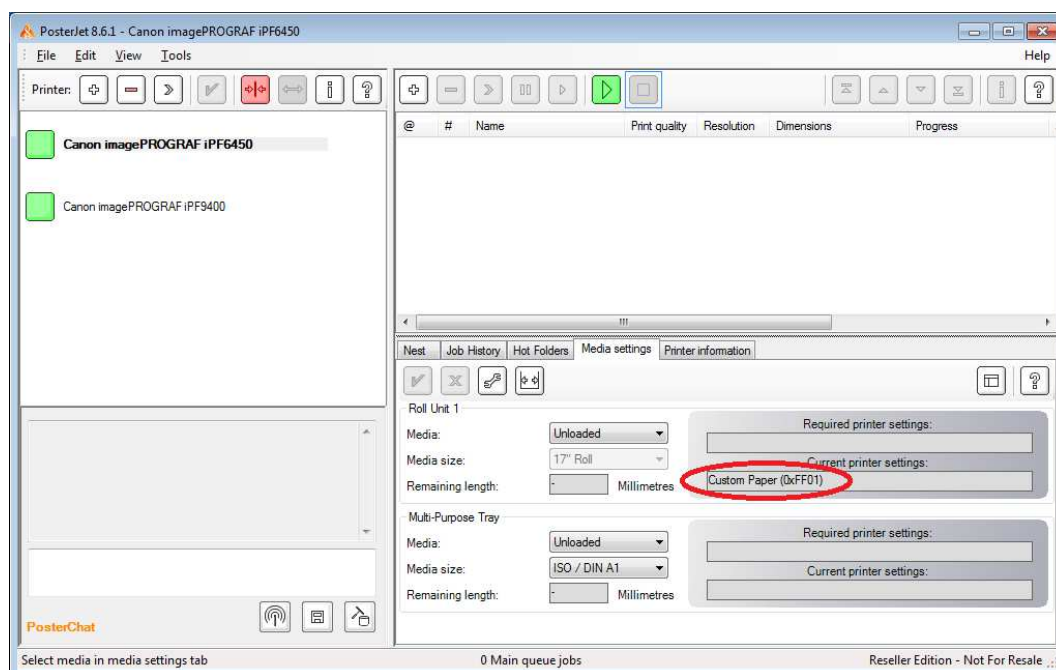

After the creation / import of a custom media type (media information file \*.ami1) using Canon Media Configuration Tool® into your printer, PosterJet 8.6.1 is now ready to use the new media setting in order to create an ICC-profile based on the new paper parameters.

Proceed as follows to dynamically create a new media type in PosterJet (e.g. Custom\_GP240g):

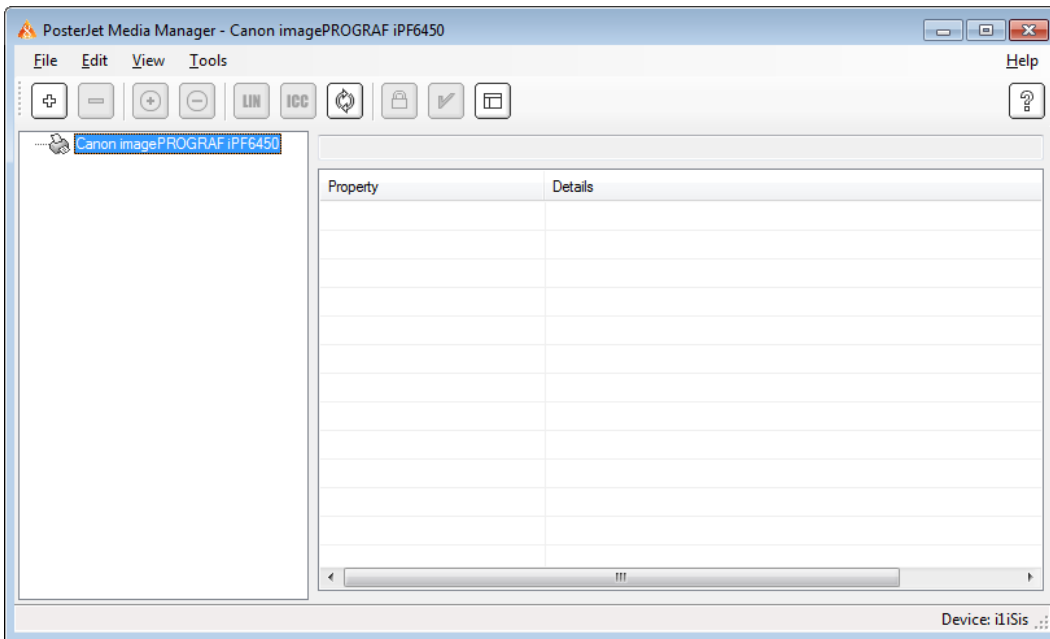

Please load the roll paper by selecting the newly created / imported media setting from the printer front panel (e.g. Custom\_GP240g for your custom Glossy Paper). The so called “extended media type” number (in brackets) is shown in the PosterJet 8.6.1 „Media Settings“ tab. You will need this number later (here 0xFF01).

Hint:

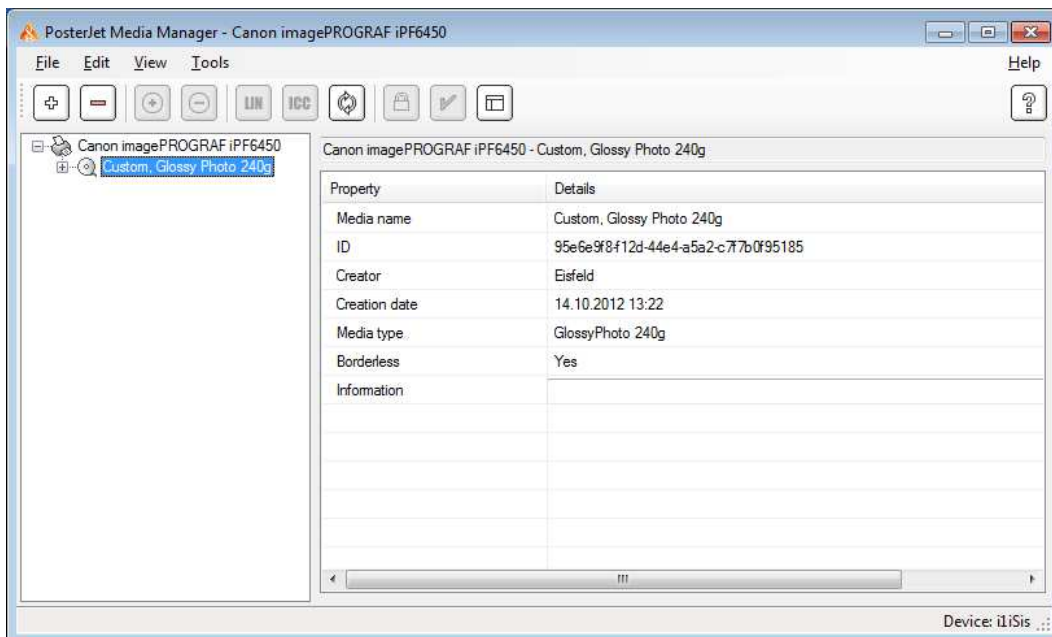

This “extended media type” is only shown for a selected custom media.

Now open PosterJet Media Manager from the Tools menu.

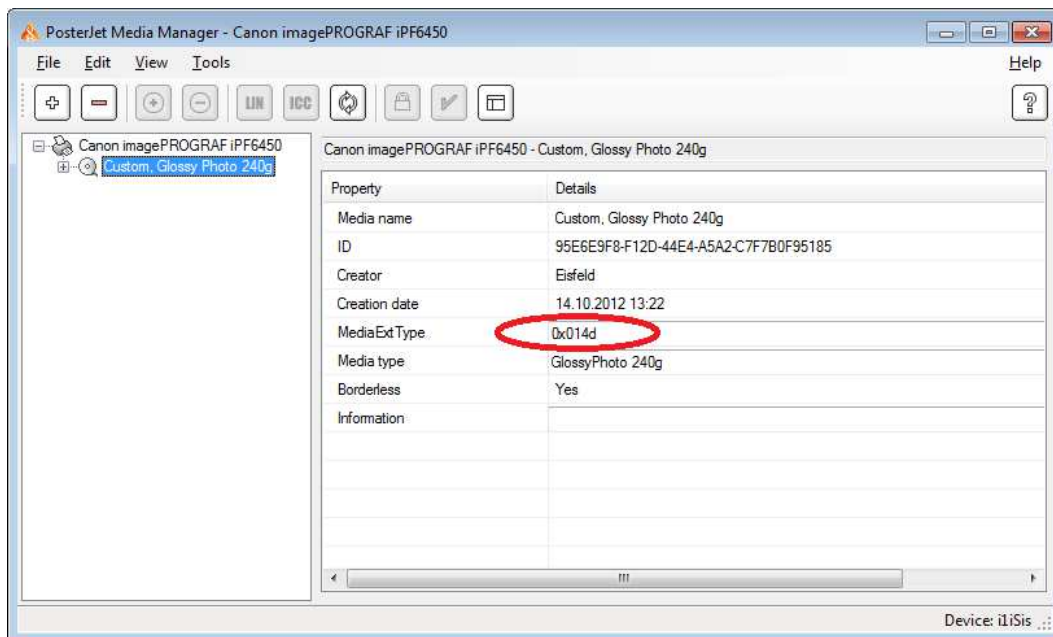

Now create a new media profile by clicking on the Plus-button (see Support Guide No. 13). Make sure the original clone settings (Standard Paper) that were used for profiling the custom paper in the printer are selected here too. Example: in the Media Configuration Tool® the setting “Glossy Photo 240g” was used to create our “Custom\_GP240g” custom media profile. For the creation of the PosterJet media profile the “Standard Paper” setting from Media Configuration Tool (here “Glossy Photo 240g”) must now first be selected.

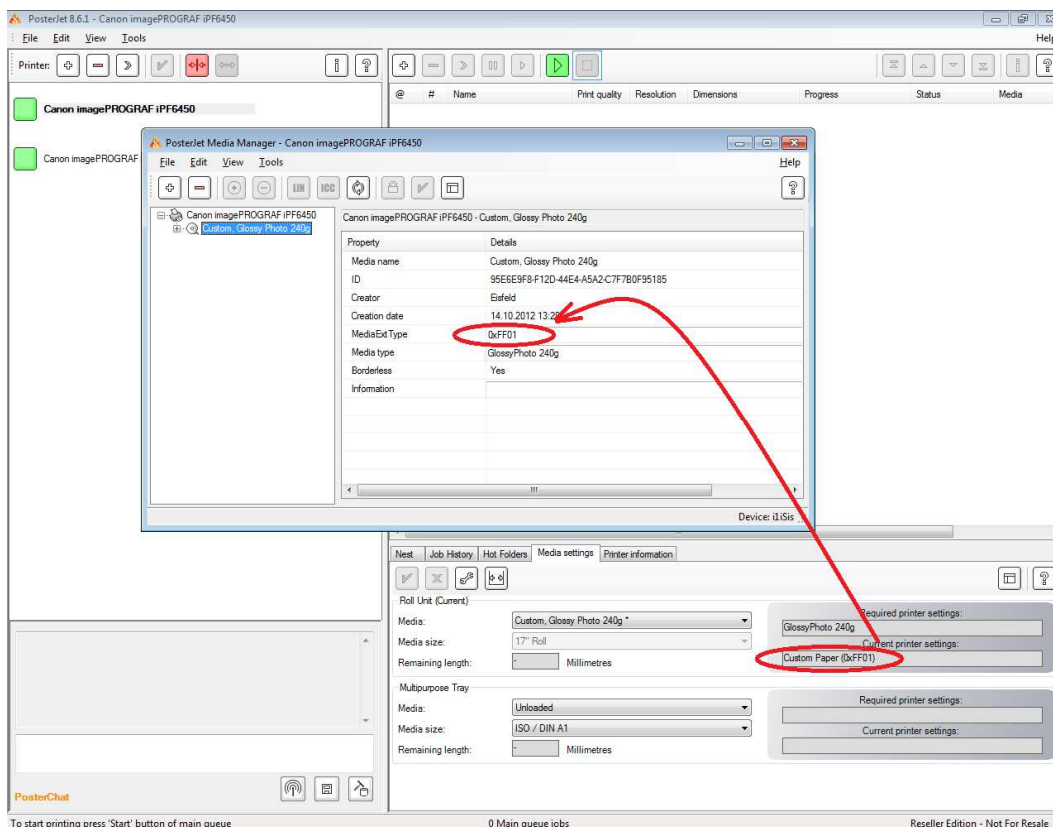

Once the media profile (not ICC-profile) has been created you must change the “MediaExt Type” in the Media Manager (here from 0x014d to 0xFF01). For this, please click on the paper name in the left part of the window and press the F5

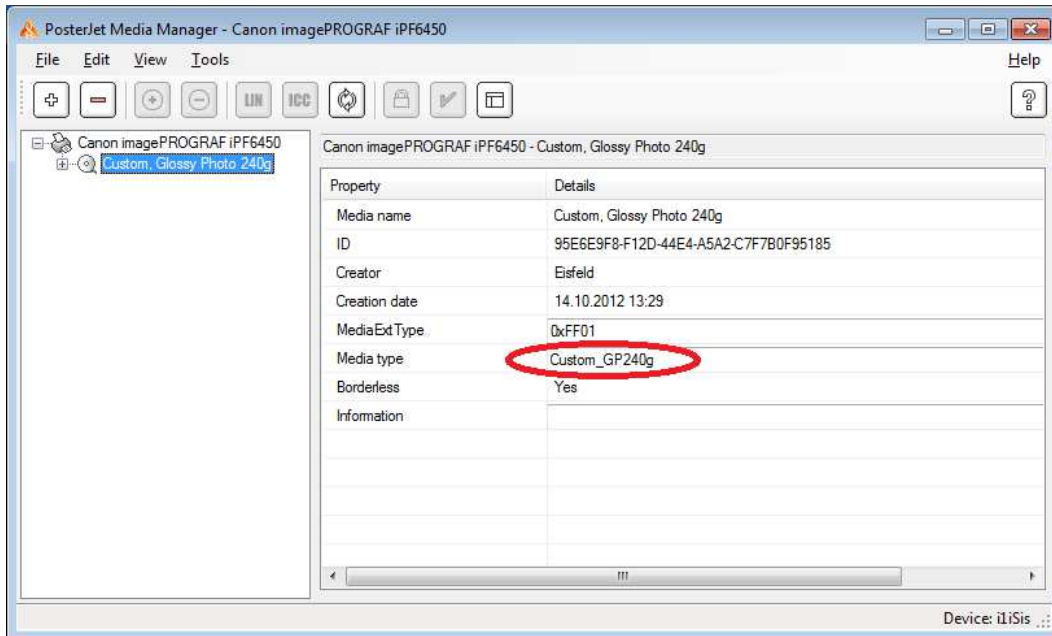

key. Repeat this procedure in order to enter the editing mode in the right part of the window (see screenshot below).

In the editing mode the media extended type (MediaExt Type) is shown. Please insert the Extended Type (exactly as shown in “Media Settings” tab) in the field “MediaExt Type” and confirm by pressing Enter on keyboard (see screenshot below).

Using this setting will enable PosterJet 8.6.1 to print profiling test charts or, at a later stage, all jobs based on the select printer media type settings (ensuring perfect output quality).

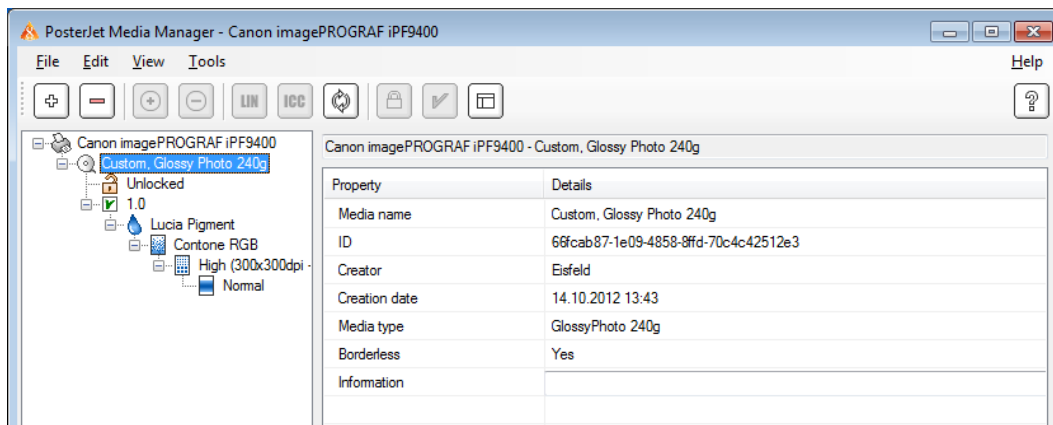

To avoid any later confusion with similar profiles in PosterJet change the name under “Media Type” – see screenshot above.

### F) Measuring a test chart printed on any large format printer using Canon SU-21 Spectrophotometer

The optionally available Spectrophotometer SU-21 enables the measurement of test charts that were printed on any other large format printer, not iPF6450. The following chapter describes how to print a special test chart for example on Canon iPF9400 and thereafter measure it on a Canon iPF6450 with SU-21 Spectrophotometer. From the measurement data obtained by the SU-21 an ICC-profile will be generated using PosterJet 8.6.1 and finally imported for the use with the original Canon iPF9400.

Proceed as follows:

Please load the paper roll in the printer of your choice (e.g. Canon iPF9400) and select the corresponding media type on the printer front panel. Now open the PosterJet Media Manager and create a new media profile for this printer (see Support Guide No. 13).

**Important:** Do not change paper feed adjustment or other length affecting parameters as the test chart may otherwise not be measured correctly on the Canon iPF6450. A paper feed adjustment may be useful, because a correct paper feed is necessary for measuring the test chart (see Printer Manual).

Now follow the instructions to print the special PosterJet test charts with the name

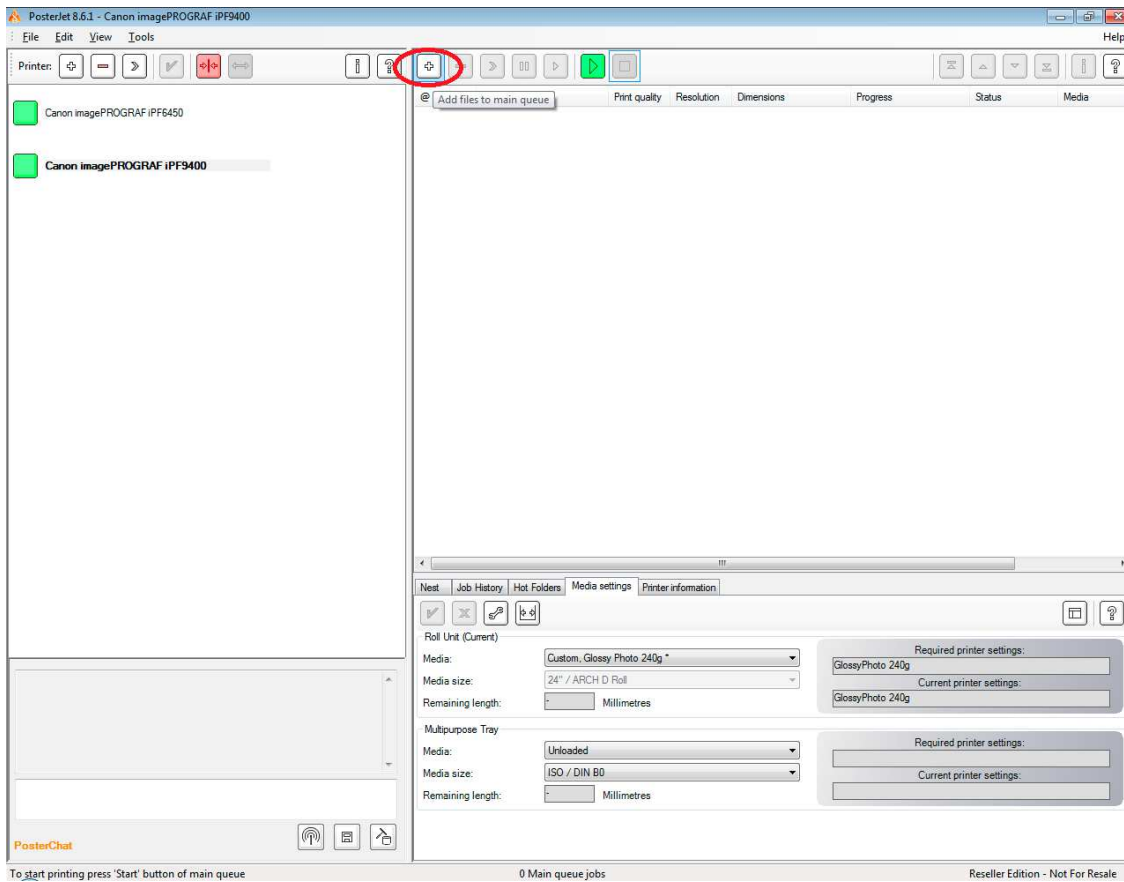

*Linear Printfile Universal Printer SU21 (XOrder).tif*  
*for media with roll width **smaller/equal 24" (610 mm)***

or

*Linear Printfile Cutout Universal Printer SU21 (XOrder).tif*  
*for media with roll width **greater 24" (610 mm)***

Unless stated otherwise the following text refers to the test chart for roll media smaller/equal 24":

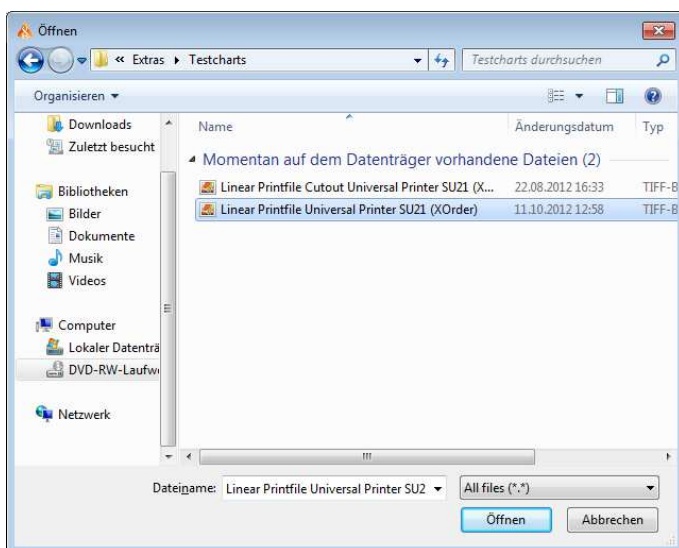

Once you have selected the new media in the “Media Settings” tab click on „Add files to main queue“ (Icon with Plus symbol).

The necessary test chart file is located on the PosterJet DVD in the folder

<<drive>>:\Extras\Testcharts\

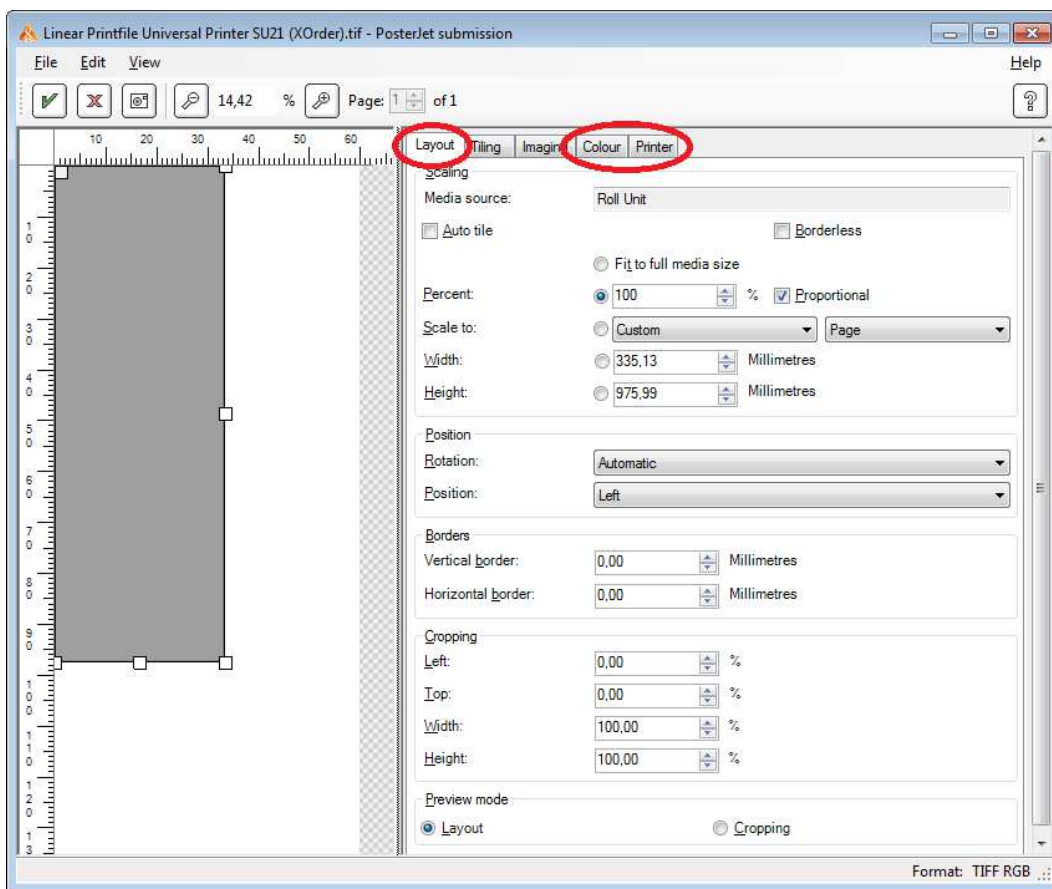

Choose this test chart file and click on “OK”.

**Important:** make the following settings in the Job Submission Window in the order described below:

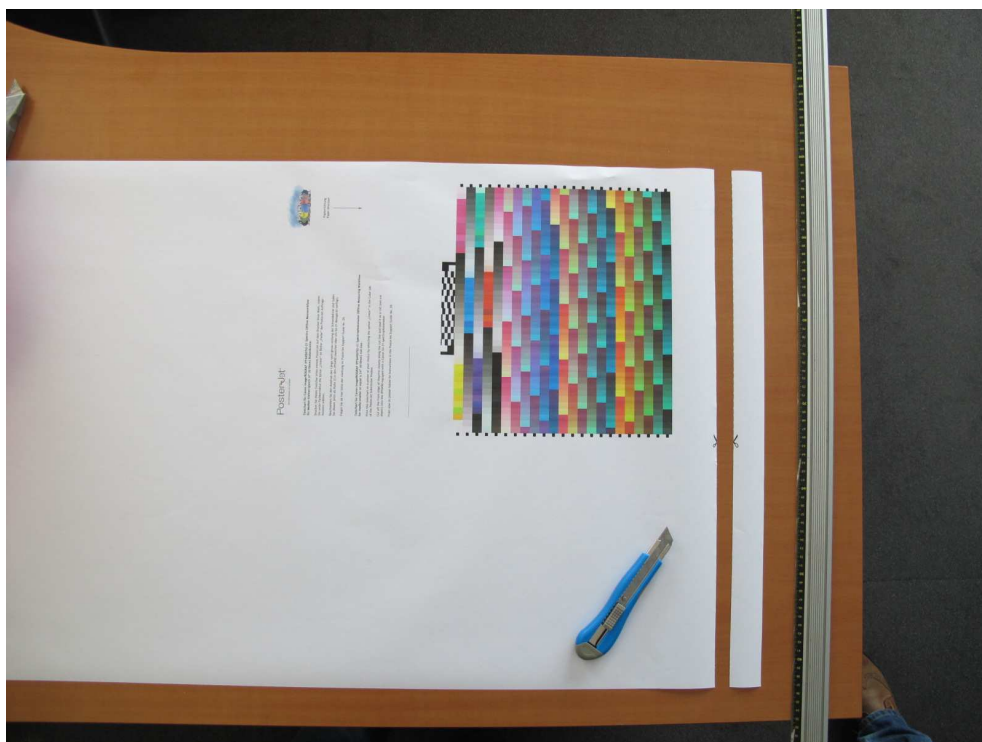

- In the “Layout” tab ensure that scaling is set to **100%**.
- In the „Color“ tab make sure that „Color Correction“ is set to „**Linear**“.
- Deactivate automatic cutting after the job has been printed. To do so remove the checkmark for the field “Cutter” in the “Printer” tab. Hint: if media is used with a roll width greater than 24" the cutter can remain switched on.

After editing the settings please click on “Submit Job” (Button with green checkmark).

After an appropriate drying time eject the roll paper **leaving the output on the roll** (that is why we recommend that you use a 24" roll).

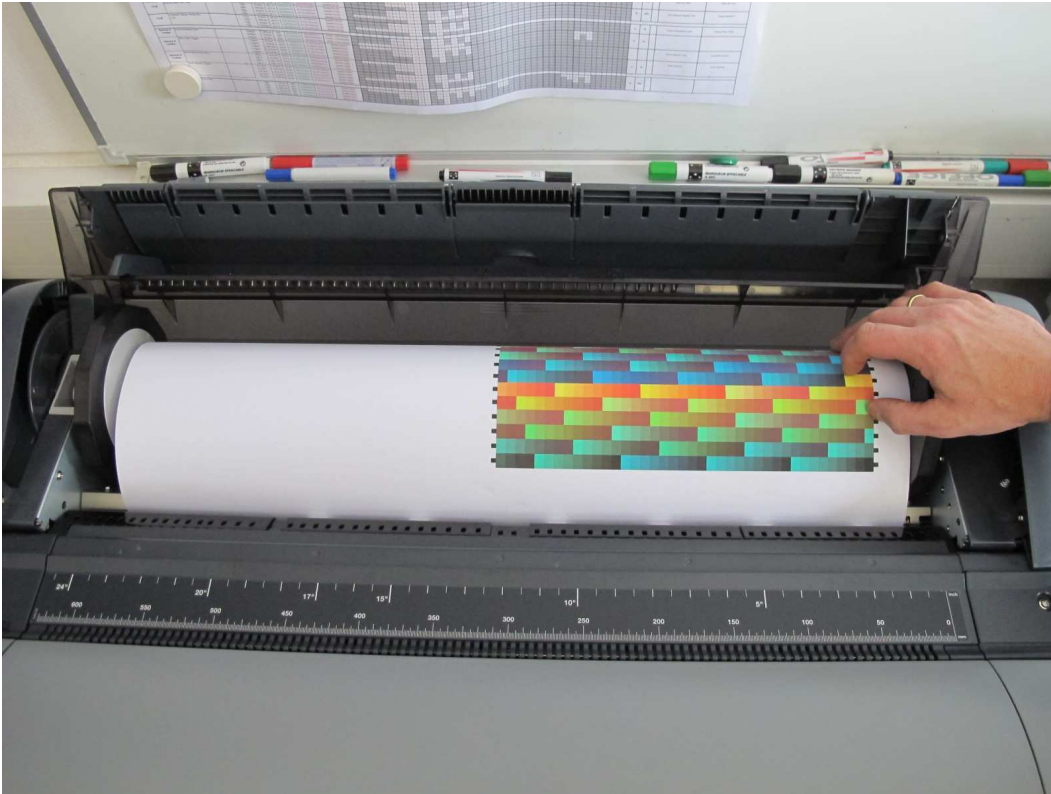

**Important:** At the beginning of the roll paper a black cutting line is printed along the paper width (scissors symbol). Please cut away the first part of the paper by cutting the paper clean and straight along this line.

**Hint for roll media greater than 24":** After printing the “Cutout” version of the chart please cut it from the roll and cut along the complete borders.

Now load this previously printed roll paper in the correct direction (printed paper shows in your direction) into the Canon iPF6450 using the option "Load Roll" (**NOT cut sheet**). Select any media type on the printer front panel (not necessarily the corresponding one) and wait until printer is ready.

**Hint for roll media greater than 24":** Please load this test chart as "Roll Media" into your printer, too. Please take care of the correct position.

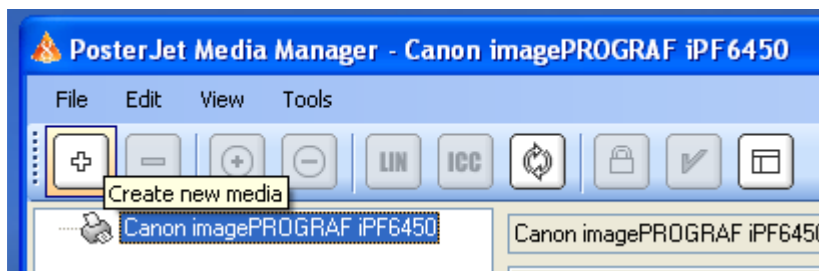

Go to the "Tools" menu in PosterJet and choose the option "Select Measurement Device". In the list of devices choose the "Canon Spectro SU-21" and click on "OK". If the measurement device is not available please follow the instructions in Support Guide No. 29 section D.

Now create a new media profile in PosterJet using the Canon iPF6450 (see Support Guide No. 13). To do so, switch to Canon iPF6450 as active printer and open the media manager and create a "DUMMY MEDIA". For further information please check Support Guide No. 13.

**Hint:** The transfer of the later calculated ICC-profile to the iPF9400 will be explained later in this document. Please note that both test charts were made only for RGB profiles, so you have to choose the "RGB-Contone" mode (see below).

Creating a new “Dummy Media” in PosterJet using the Media Manager (**quick version**):

**Step 1:** Create a new media pressing the "Plus"-button in the PosterJet Media Manager.

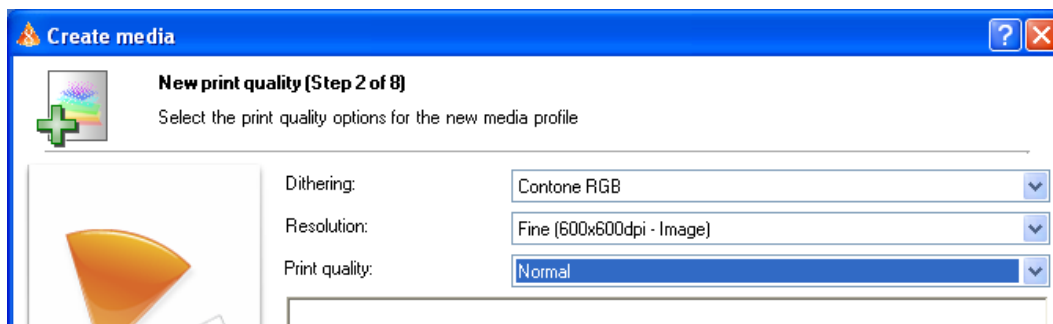

**Step 2:** Click on "Next" to start the Wizard.

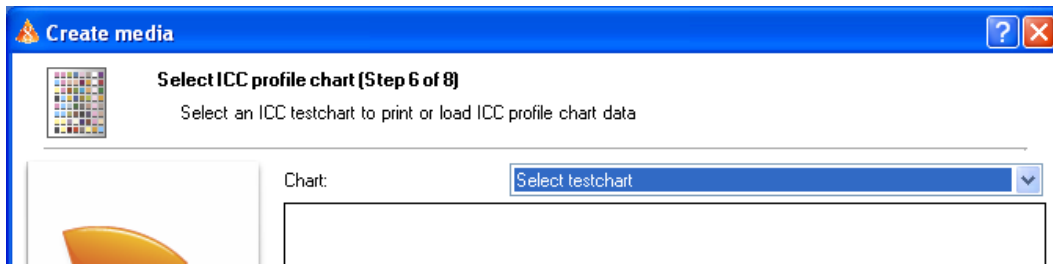

**Step 3:** Enter the name of the media and choose the media typ. Now click "Next".

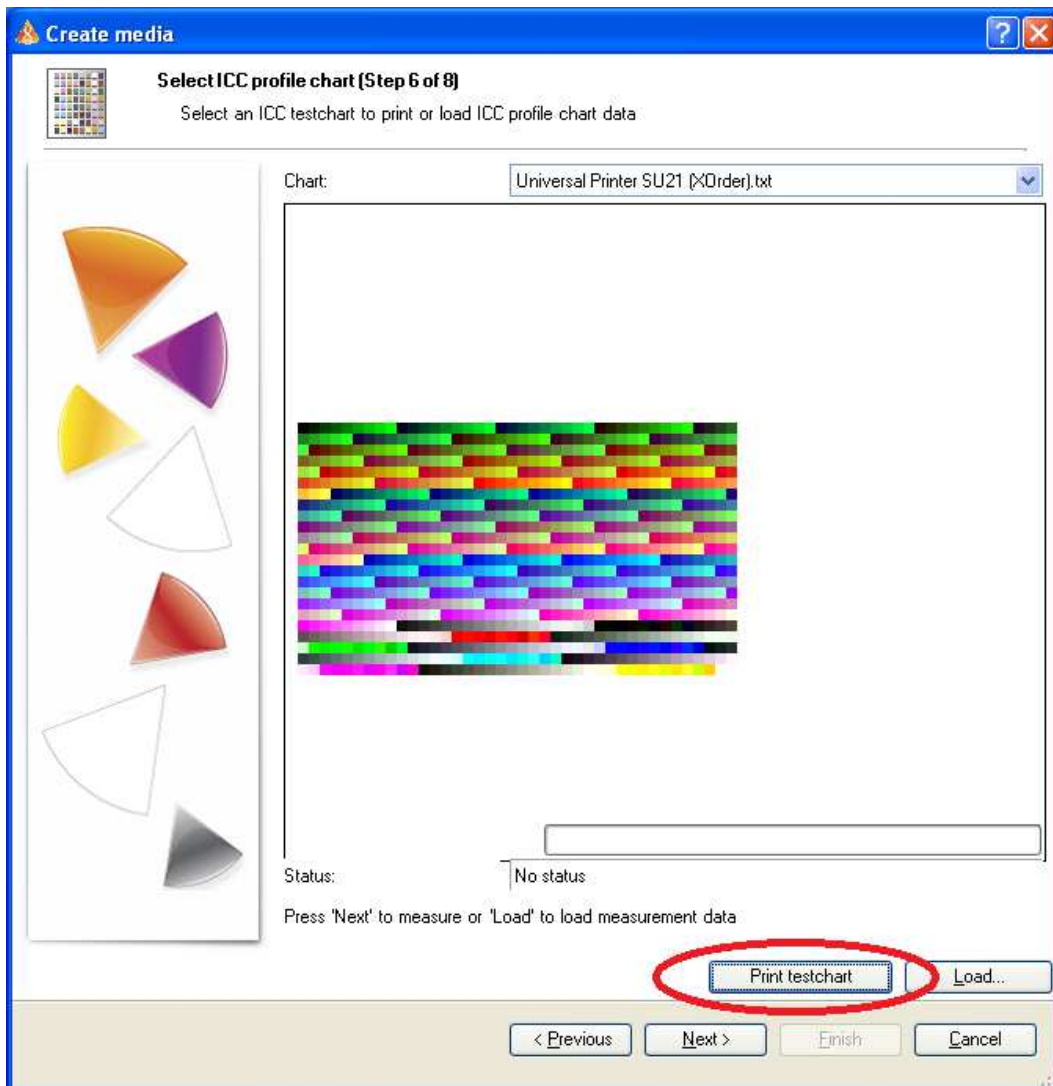

**Step 4:** Choose “Contone RGB” under Dithering and select Resolution and Print quality. We recommend you to select Fine (600x600dpi) and Normal.

**Step 5:** Choose the test chart *Universal Printer SU21 (XOrder).txt* from the drop down menu.

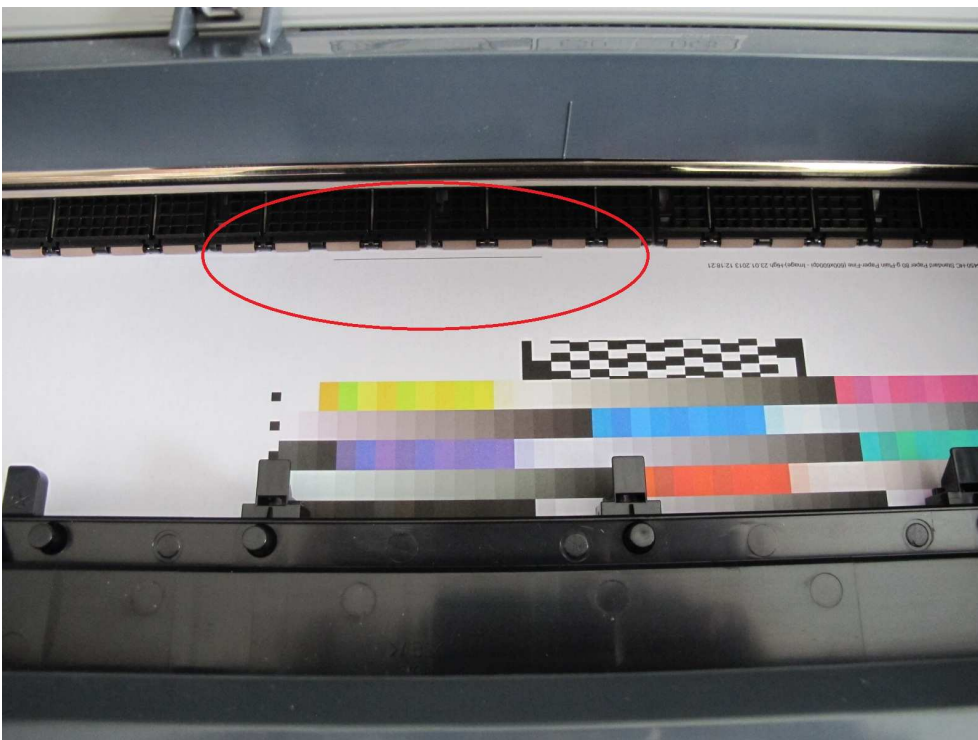

Now click on „Print testchart“. Ensure that the PosterJet main queue is started so that the print can be performed quickly. This test chart will actually just forward the already printed paper to the correct position for the measurement, without printing anything onto the paper.

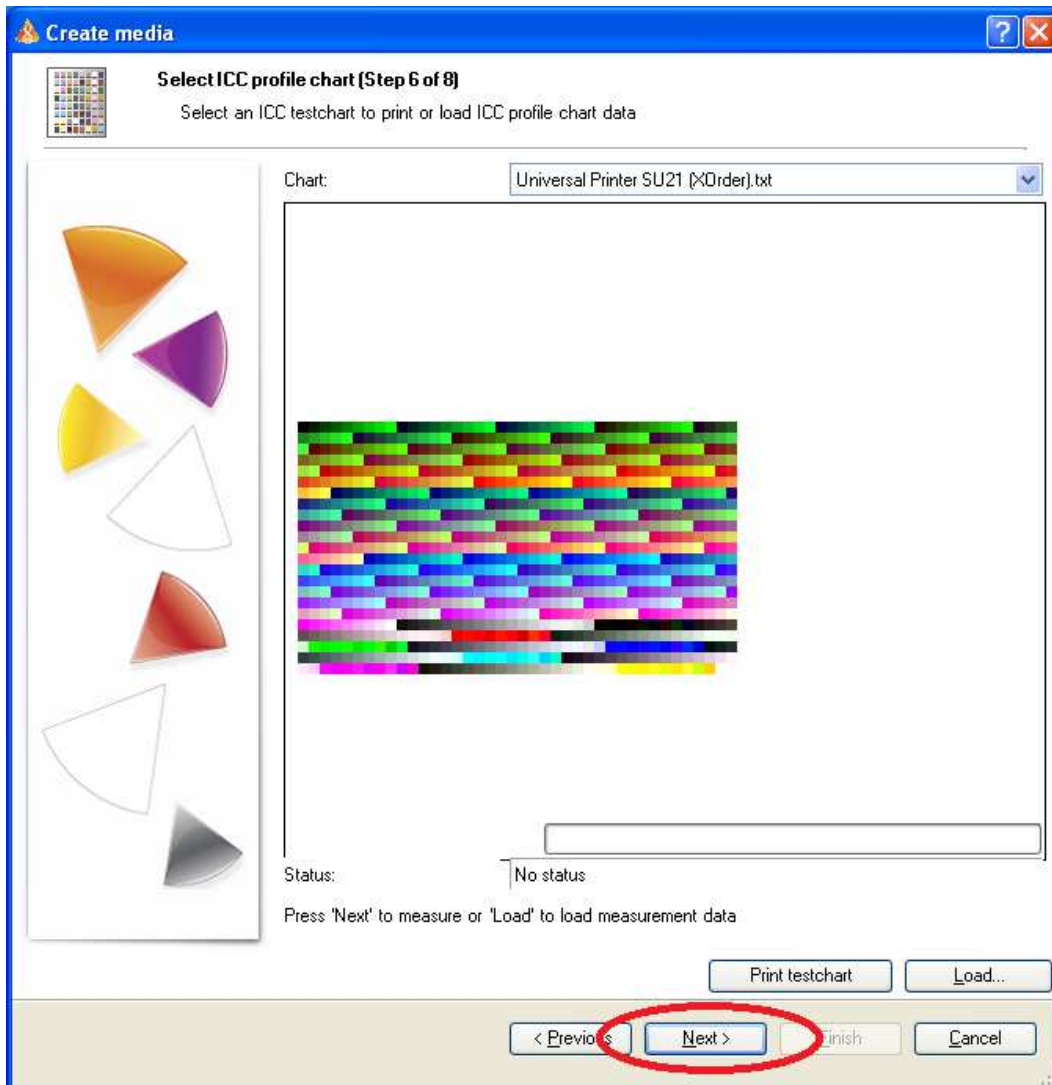

**Step 6:** The correct position of the pre-printed test chart can be controlled by opening the top cover and ensuring that the fine line seen in this pictures is currently placed right in front of the roll holders.

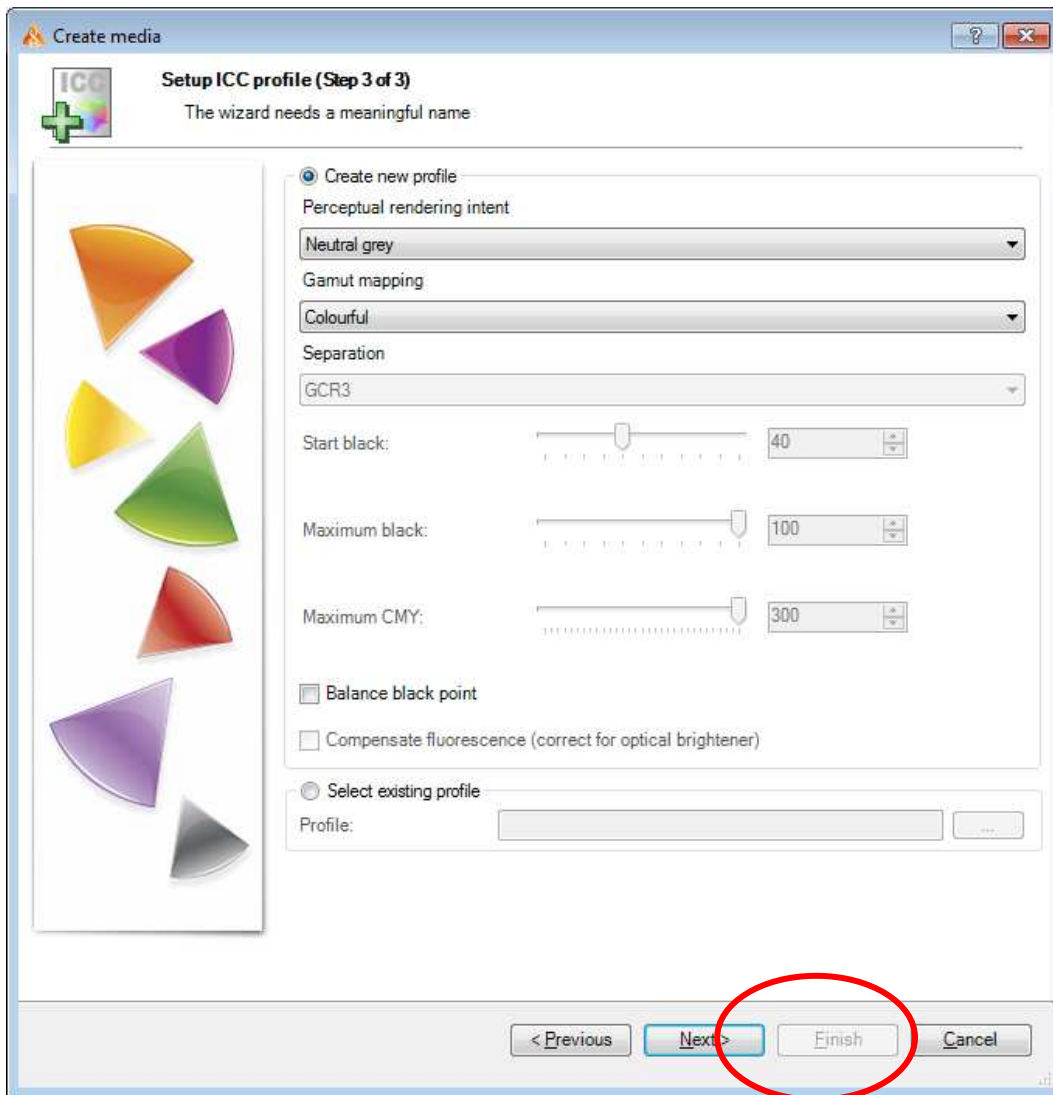

Enlarged image (see fine line)

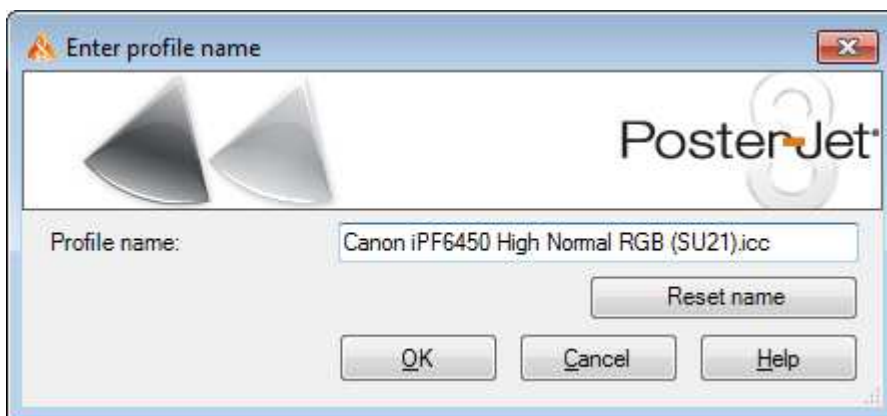

**Step 7:** Once the “printing” is complete and you have checked the position of the paper, click “Next” to start with the measurement of the colour patches. PosterJet will display a message as soon as the measurement is completed. Click “Next” to move to the next step.

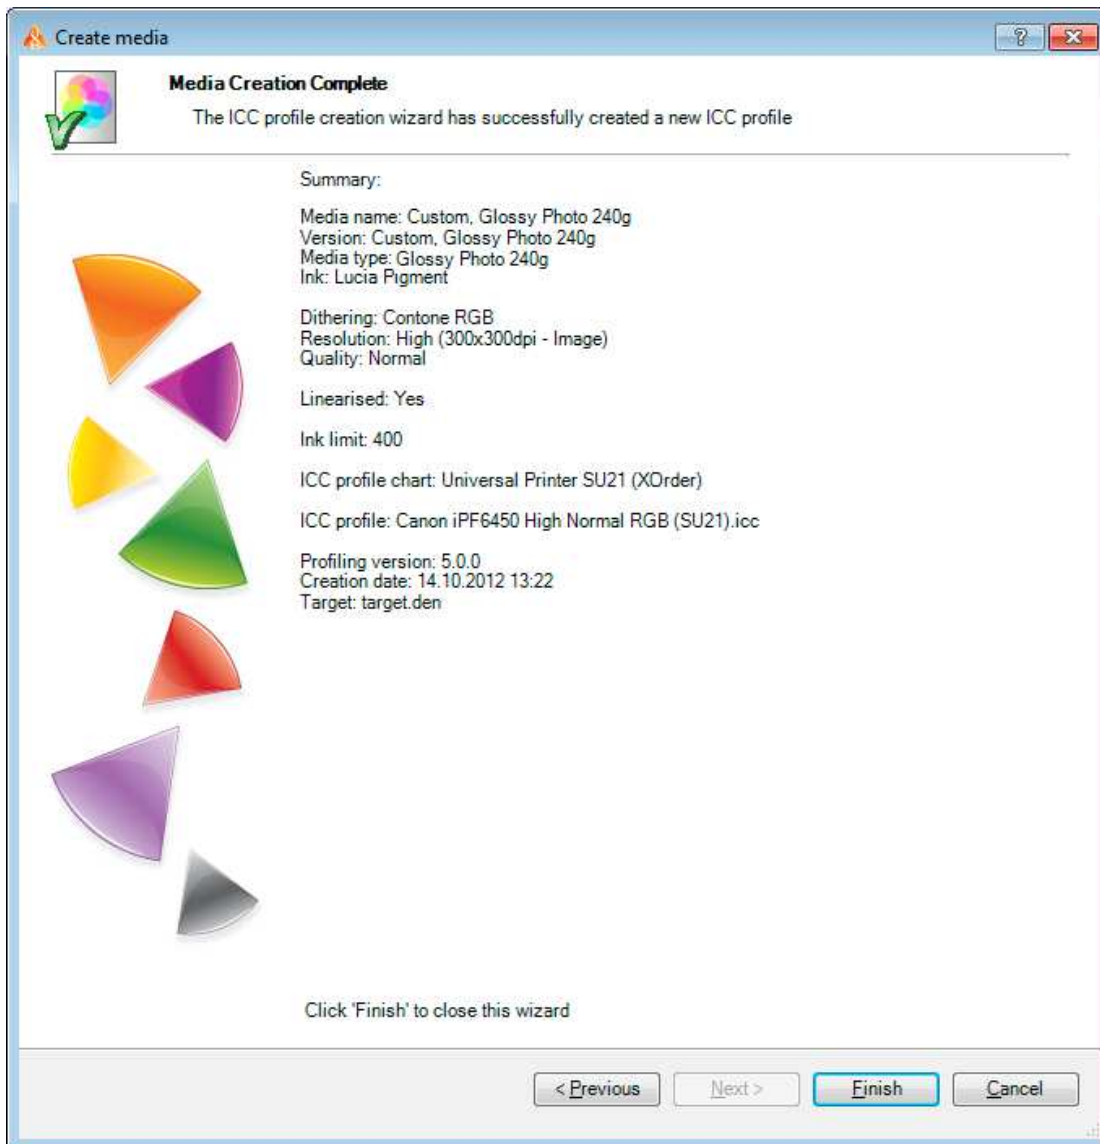

**Step 8:** Select „Balance black point“ and „Compensate fluorescence“ if required. The switch for correcting optical brighteners will only appear, if the measurement has found them in the paper. Click “Next” to finalize the profile creation process.

**Step 9:** Enter a new name or use the default name for your new profile. We recommend that you chose a unique name, so there will be no confusion at a later stage. Click on “OK” to start the calculation.

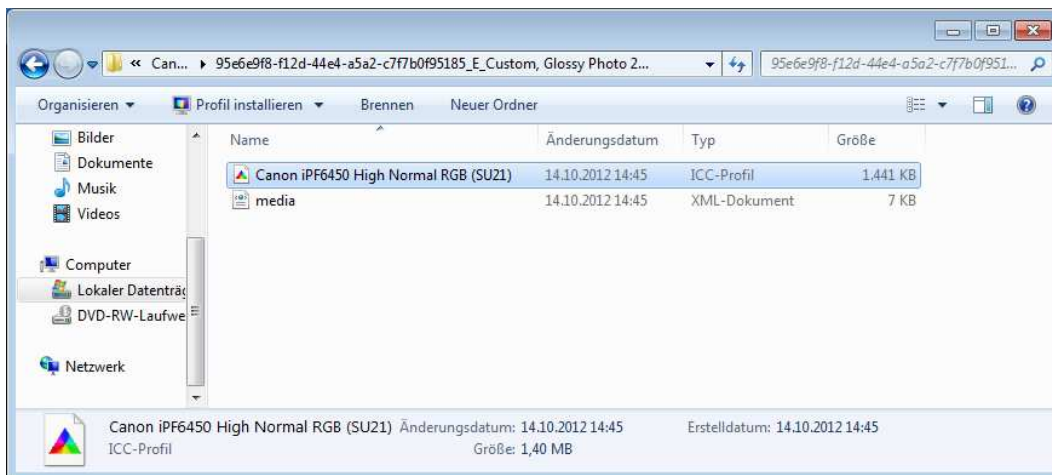

**Step 10:** After the successful creation of the profile a summary appears.

Now click on "Finish" to complete the process. Your profile has automatically been copied to the "DUMMY MEDIA" folder.

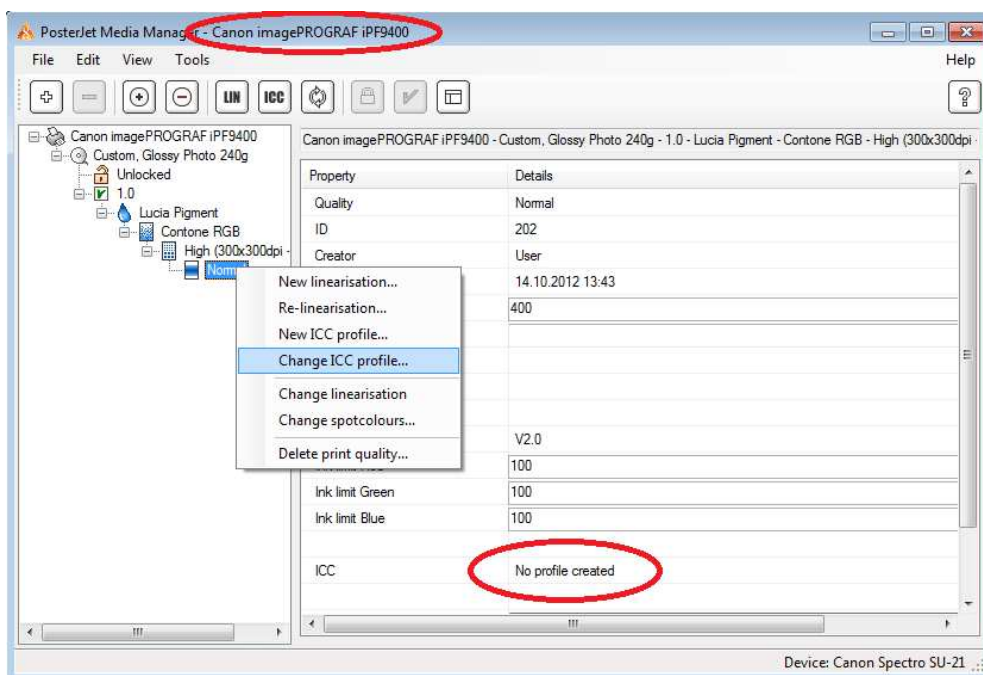

In order for PosterJet to use this new profile together with the original printer, it is necessary to import the ICC-profile to the corresponding media and print quality of our original printer (here: iPF9400). To do so, please open the Windows Explorer and copy the ICC-profile on the Desktop (or any other location of your choice).

Newly generated ICC-profile can be found in the Canon iPF6450 PosterJet printer folder located at:

C:\Programme\Eisfeld Datentechnik\PosterJet V8 Admin Tool\  
wwwroot\PJServer80\App\_Data\Printer\Canon\_iPF6450\

Now switch back to the original printer in PosterJet (here: Canon iPF9400) and open the Media Manger.

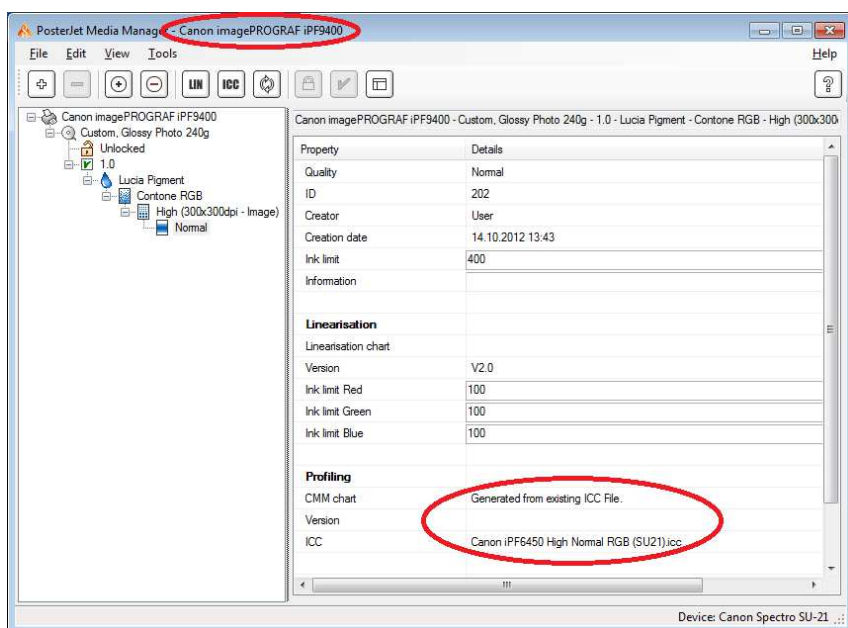

Open the media tree. Select the print quality and click with the right mouse button to open the context menu. Choose “Change ICC profile...” to import your new ICC-profile. Note: the ICC-file will automatically be copied into the corresponding iPF9400 Printer/Media folder and connected to the print quality.

The following window will open.

Select the previously saved ICC-profile and click “Open”.

The imported ICC-profile is shown under "ICC" in the Media Manager information window. If you are now printing with PosterJet using this media and print quality, exactly this ICC-profile will automatically be used for every upcoming print job.

**Hint:** After the import of the measured test chart to the original printer the folder of the "Dummy Media" for the iPF6450 can be deleted to prevent any later confusion.

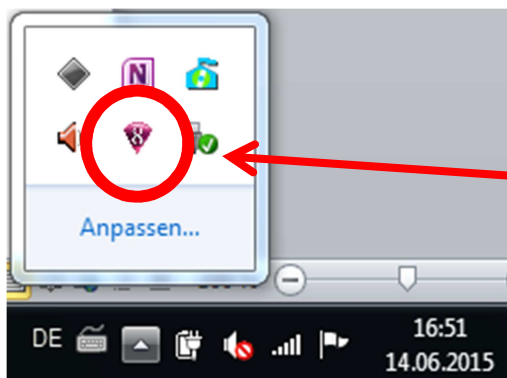

## Database backup and restore

PosterJet settings and templates are stored in a database. If you wish to backup all PosterJet parameters, including installed printers, templates, hot folders, Client settings, and many more, we recommend you perform a backup of the PosterJet database.

A defective database can lead to PosterJet Server issues (Server not starting). In such cases it can be useful to have a working backup of the database file in order to repair PosterJet.

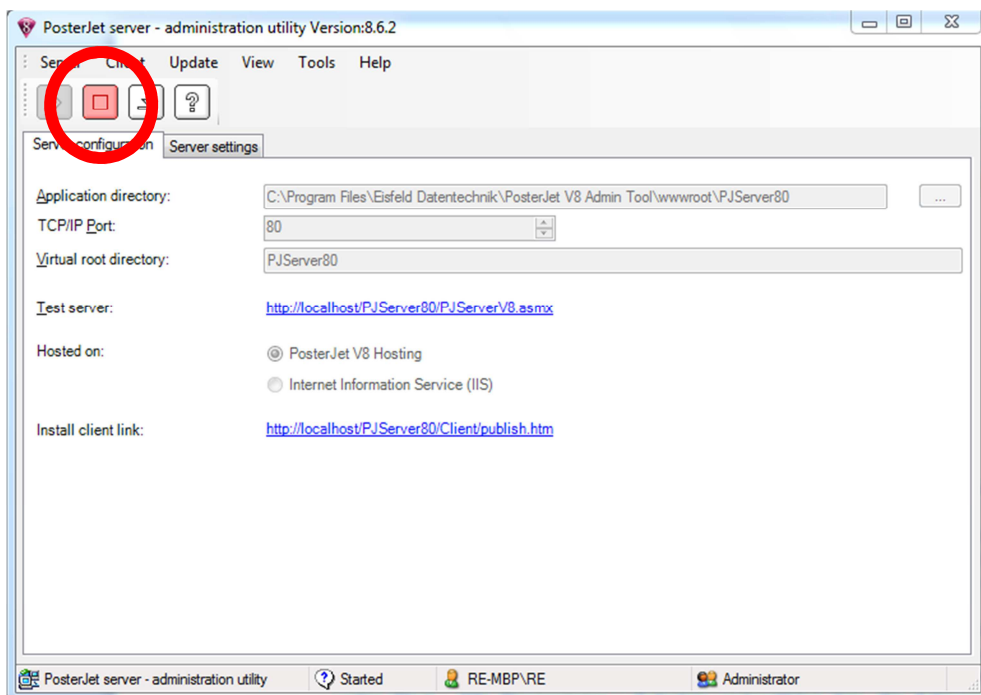

### Method 1: for operation of PosterJet under V8 Hosting

Open the interface of the PosterJet Administration Utility

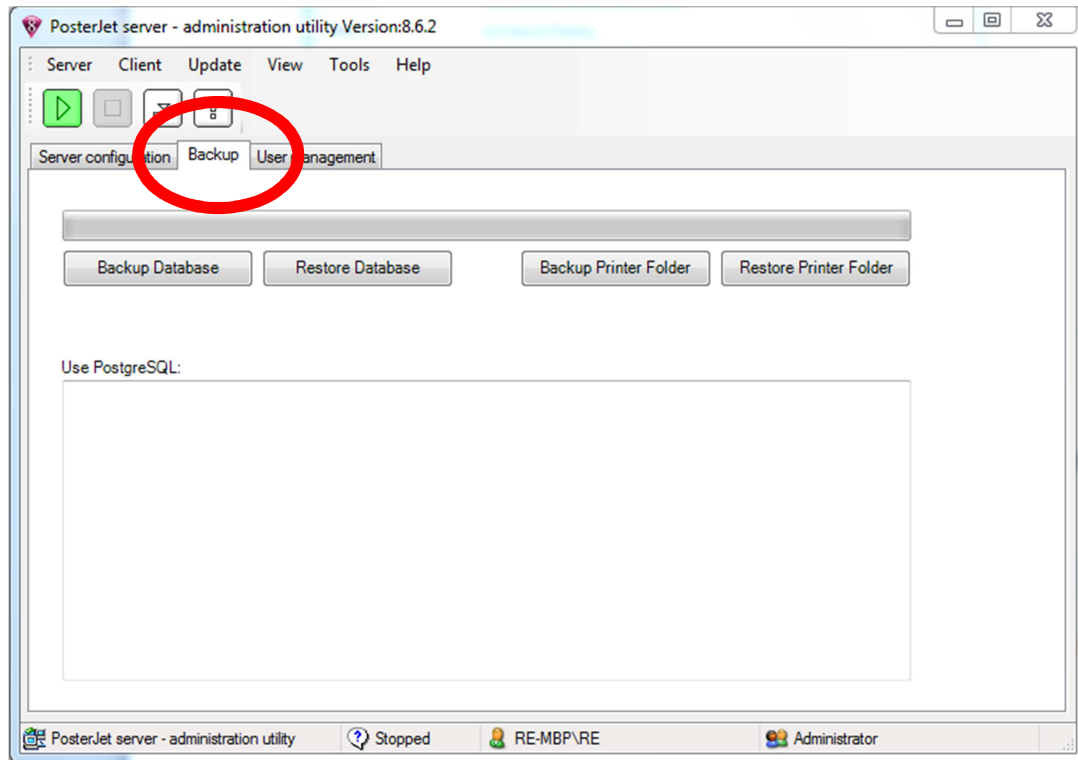

Windows status bar with active applications. Click PosterJet Administration Utility twice in order to open the interface.

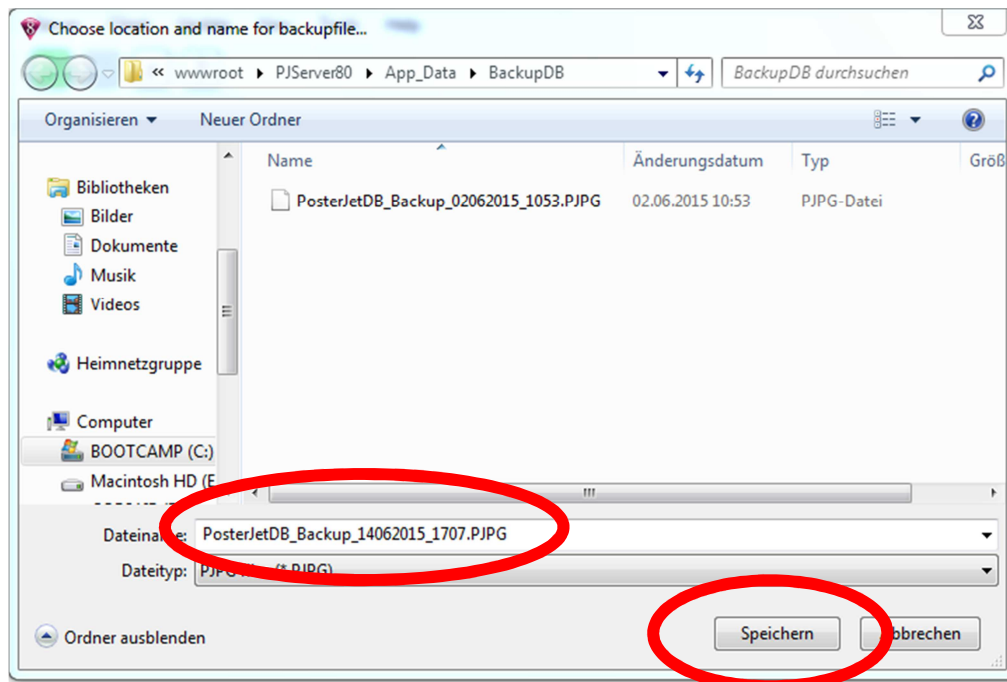

Make sure no jobs are currently processed or printed by PosterJet before you stop the Server by clicking the „Stop“-button.

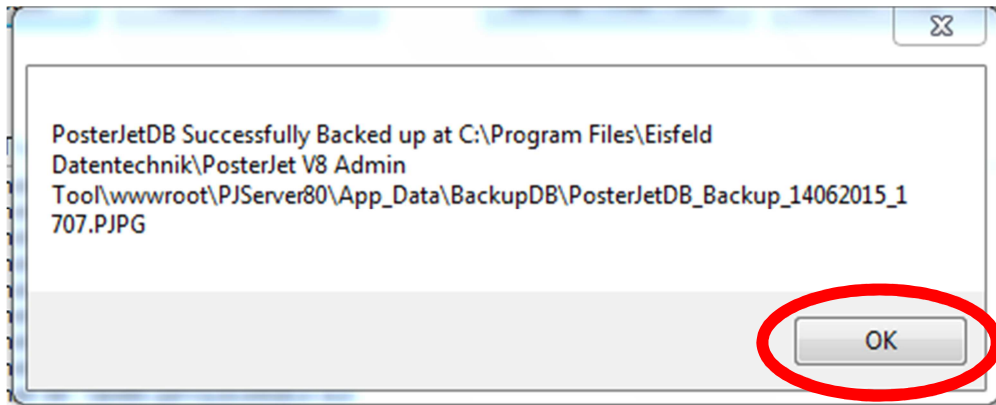

Two new tabs appear. Click the „Backup” tab.

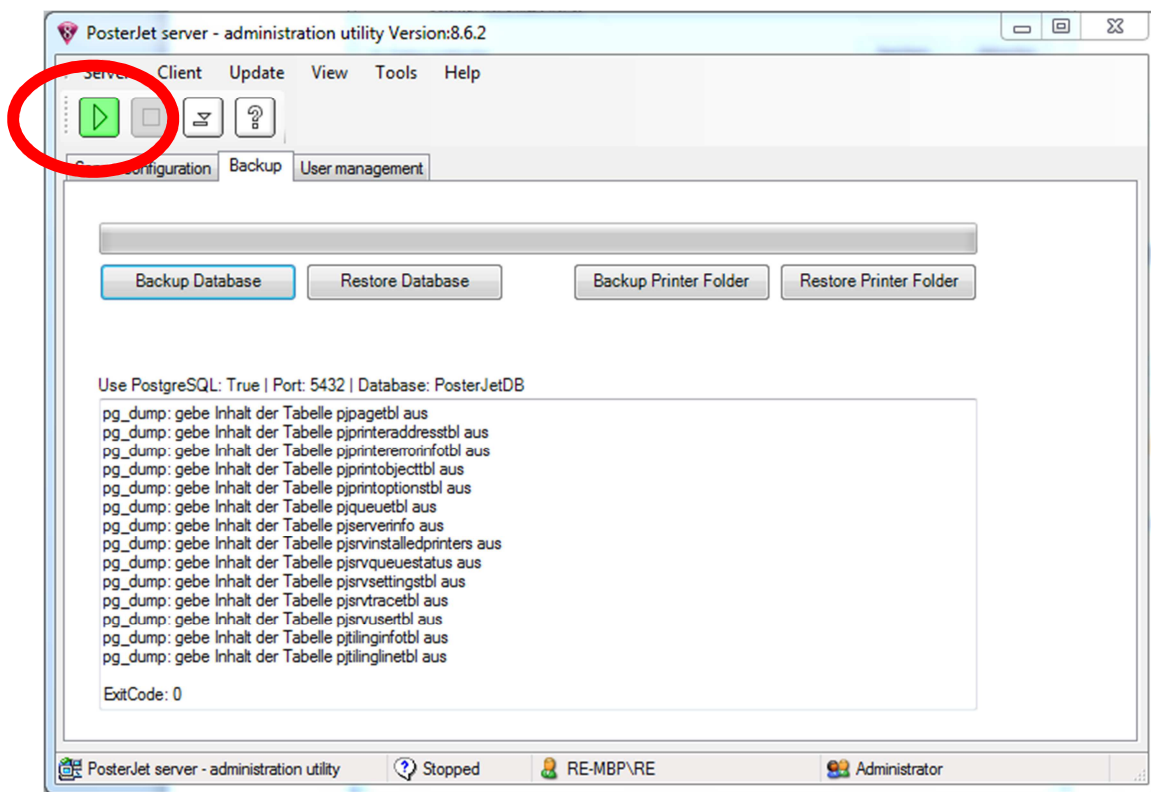

Now click the button „Backup Database“. An explorer window opens. Accept or change the suggested name for the backup file and click the “Save”-button.

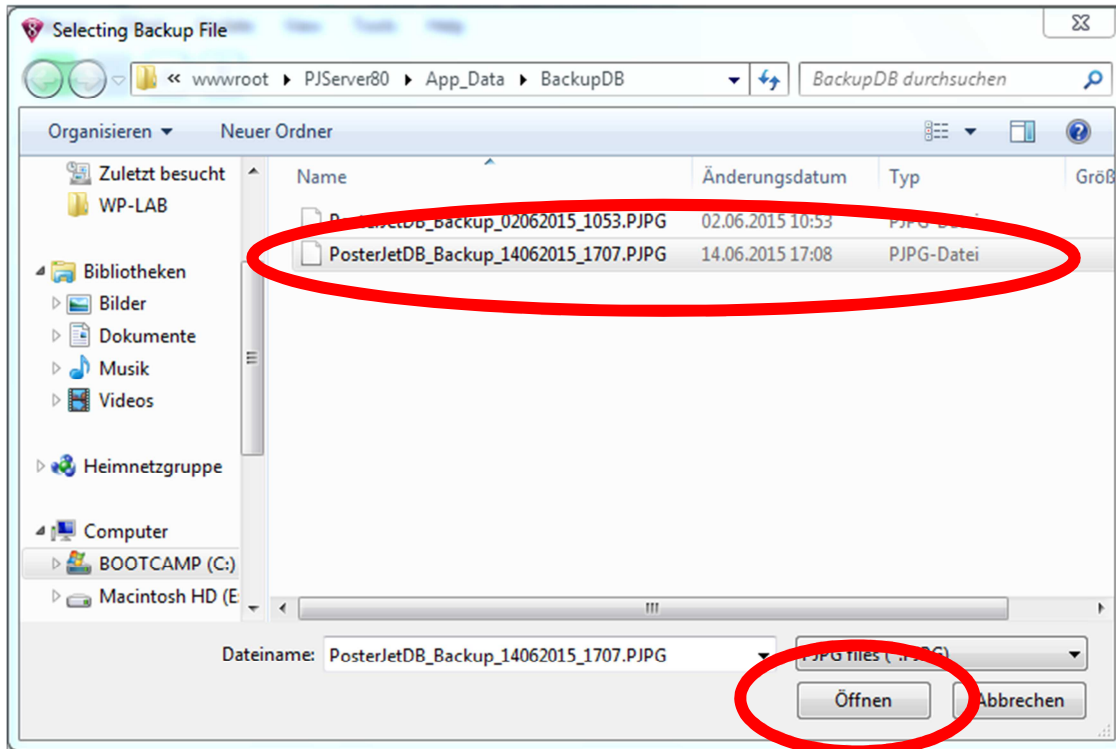

Terminate the procedure by a click on the „OK“ button.

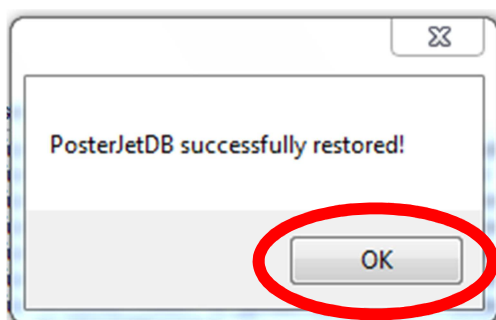

Finally, do not forget to restart the PosterJet Server by a click onto the „Start“ button.

Restore the PosterJet database by following the same procedure as described above, but with the difference that you select the button “Restore Database” instead of “Backup Database”. Chose the backup file you wish to restore and click „Open“.

Once completed click the „OK“ button to finalize the restore procedure.

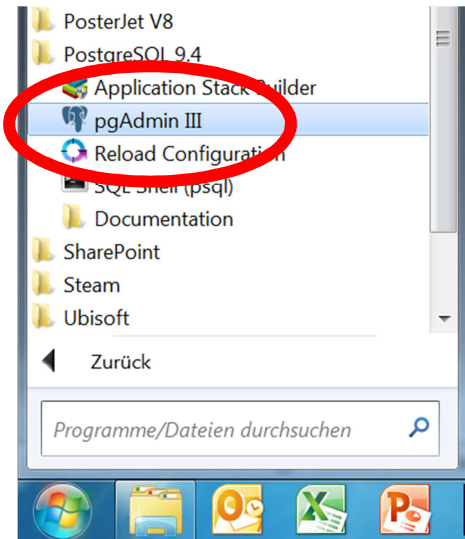

**Hint:** After a restore PosterJet hot folders only reappear, if the Client ID remains the same as the one that was used during the setup of these folders. You find the Client ID in the file „PosterJetClient.ini“ located in the following folder (you may have to backup the ID as well):

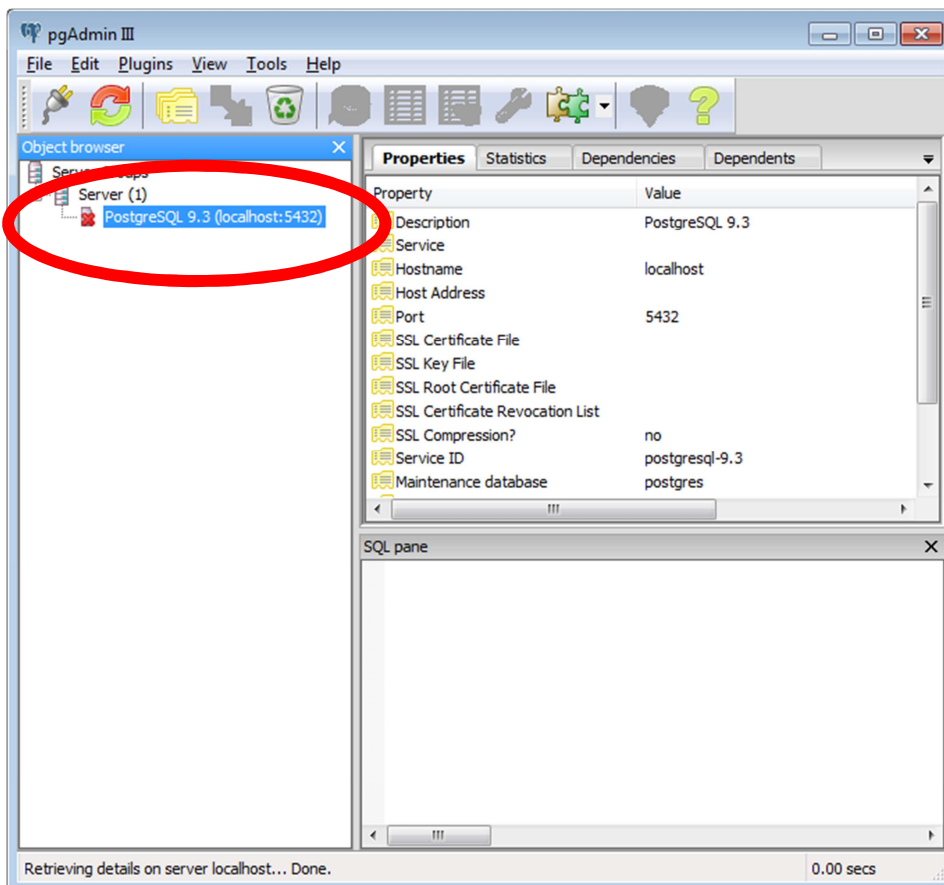

C:\Users\<current user>\AppData\Roaming\Eisfeld Datentechnik GmbH & Co. KG\  
PosterJet 8.7\8.7.5723.15896\

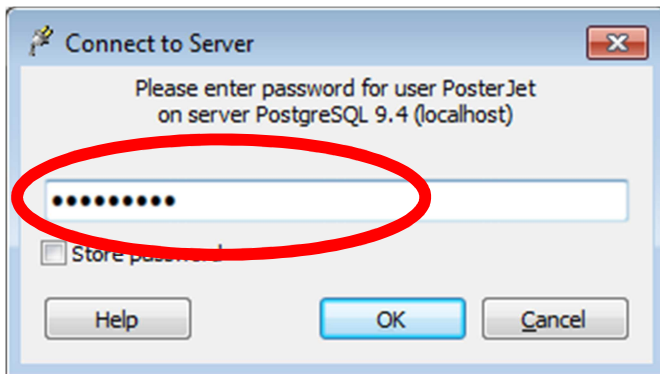

## Method 2: for operation of PosterJet under Windows IIS

We recommend a different method for a database backup and restore if PosterJet is operated under Windows Internet Information Services (IIS). Please open the application „pgAdmin III“ under the Windows Start menu entry „PostgreSQL 9.4“.

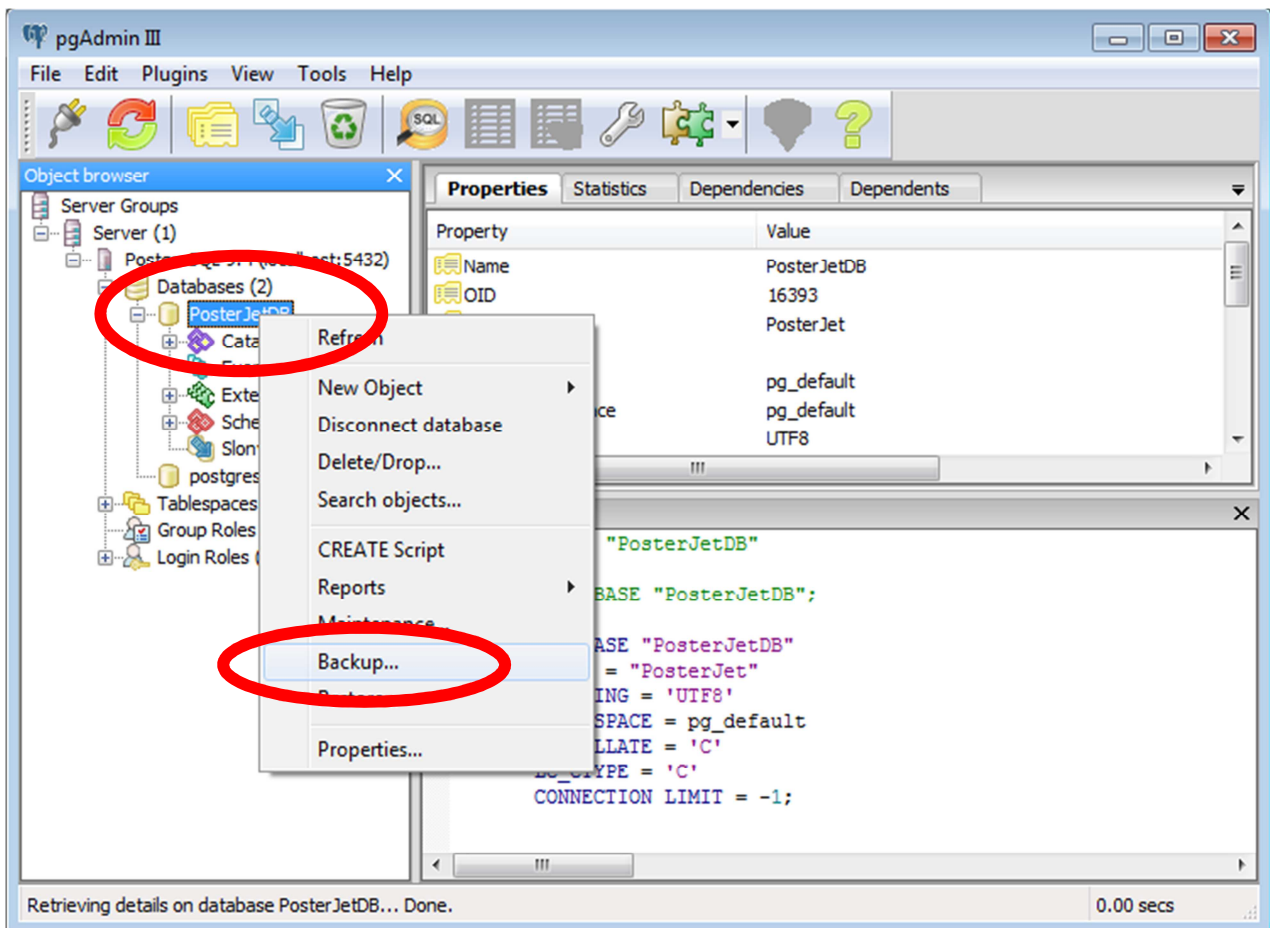

Open the PosterJet database by double clicking the entry „PostgreSQL 9.4 (localhost:5432)“ in the window „pgAdmin III“.

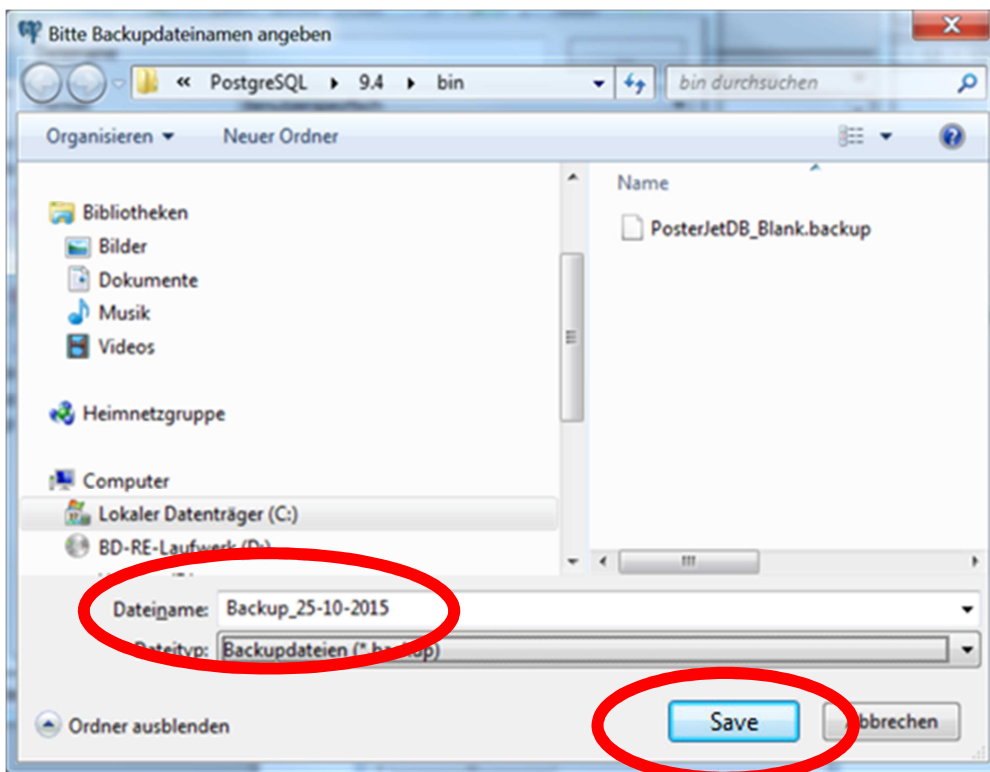

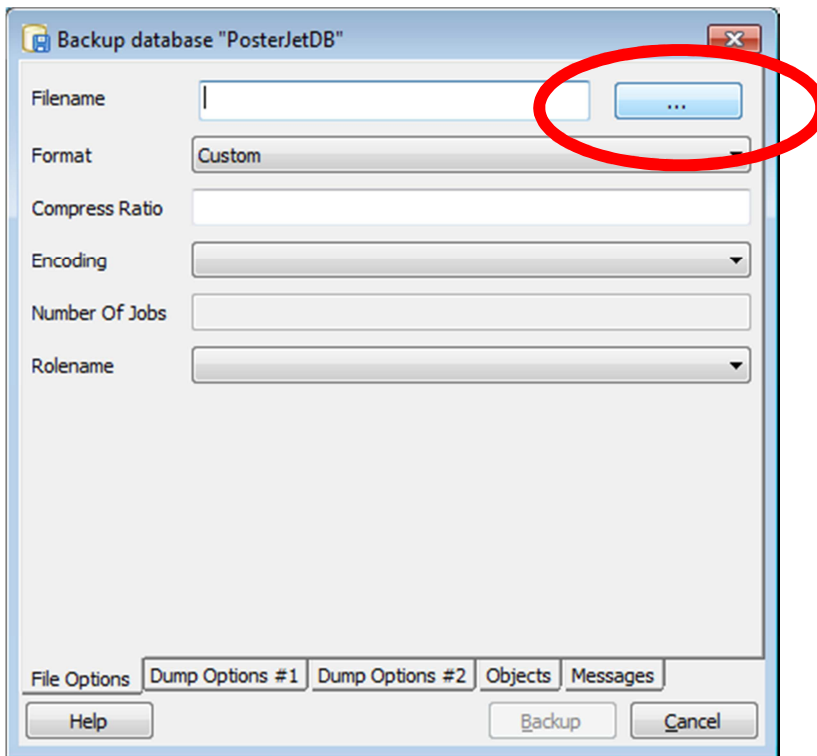

Enter the password and continue by clicking the “OK” button. The password for the PosterJet database is:  
**PosterJet** (case sensitive).

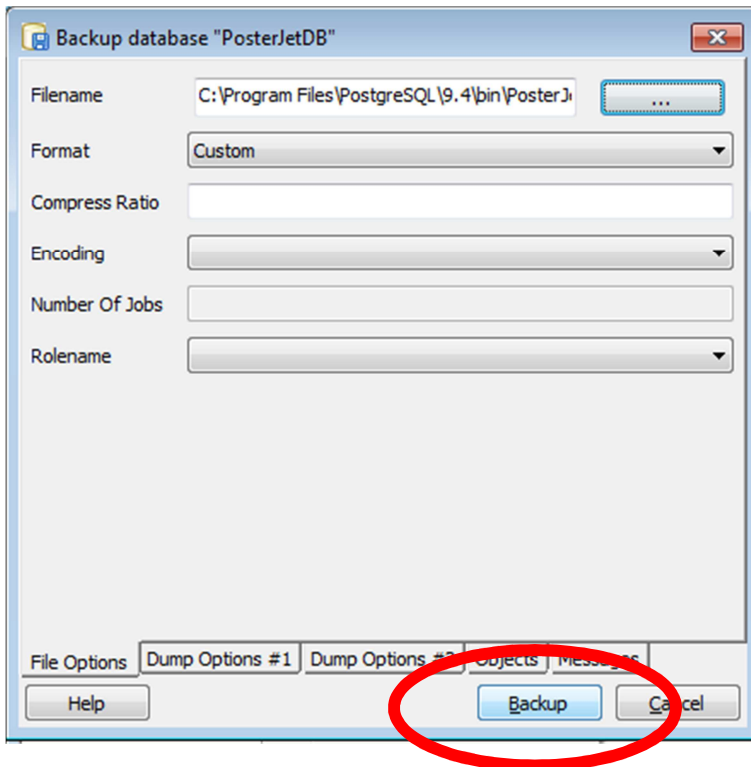

Click „OK“ once you have entered the password. Start the database backup by right clicking the entry „PosterJetDB“ and select the option „Backup...“ from the context menu.

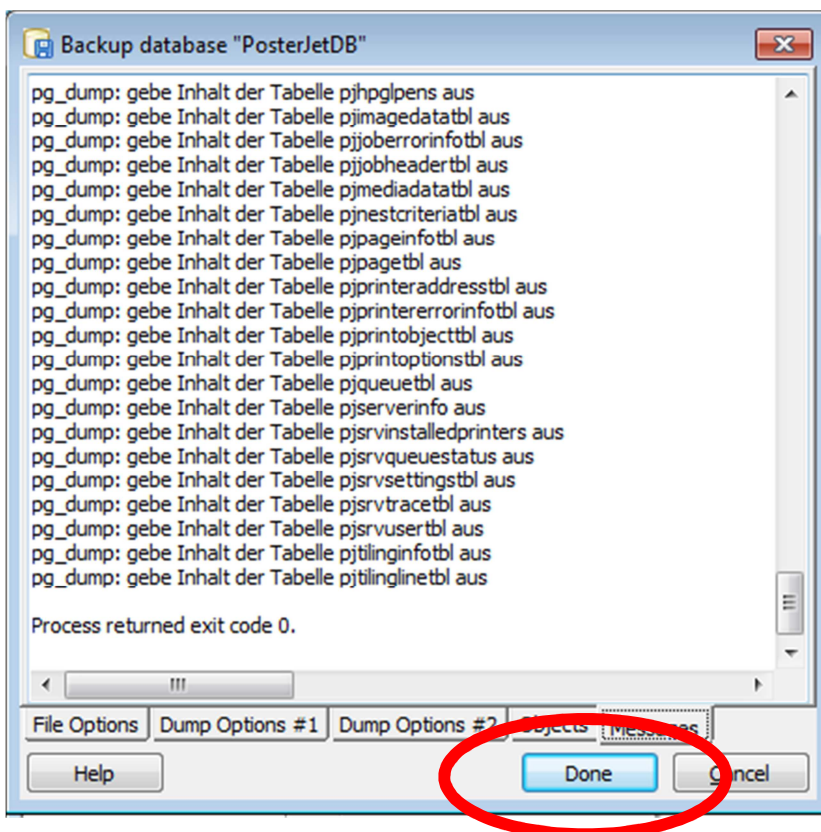

A new window will open. Click the button with the 3 dots in order to enter a name for the backup file (here: Backup\_25-10-2015). Then click the “Save” button to save the database backup file.

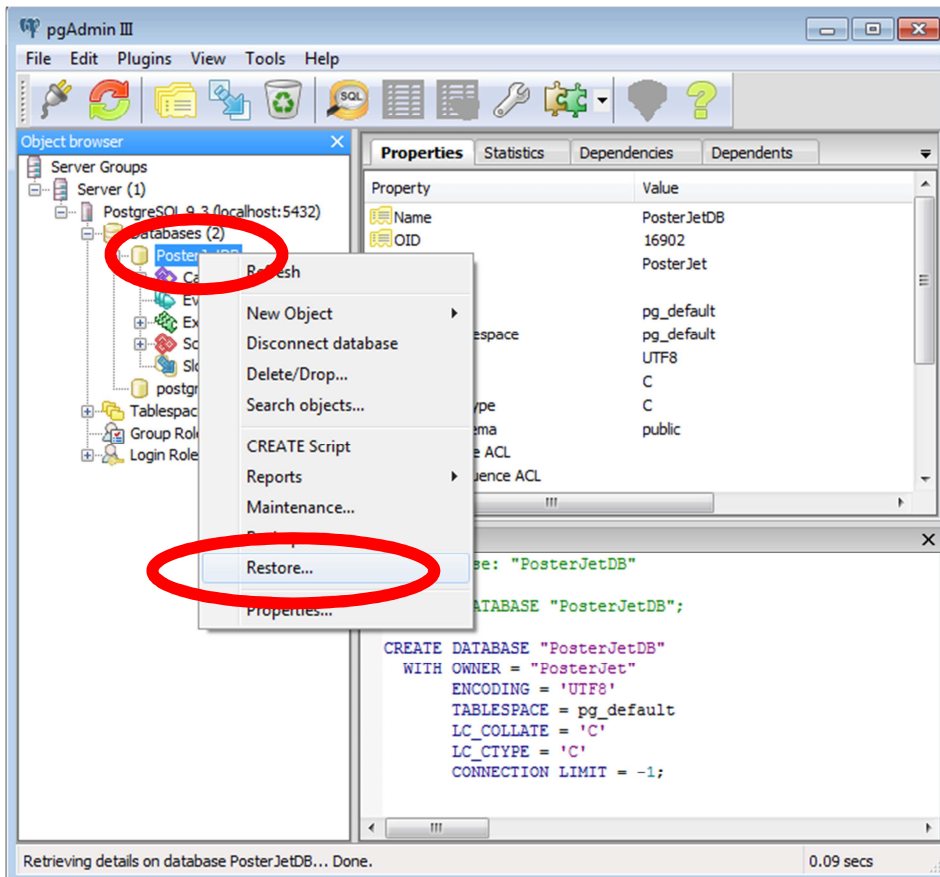

Now click the „Backup“-button that became visible to complete the process.

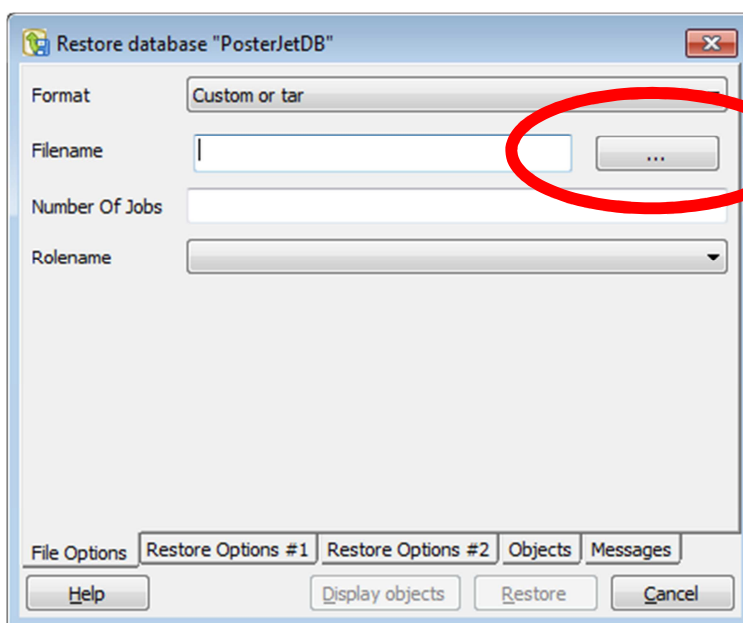

A successful backup is shown by an Exitcode = 0. Terminate the backup process by clicking the „completed“-button and close the application „pgAdmin III“.

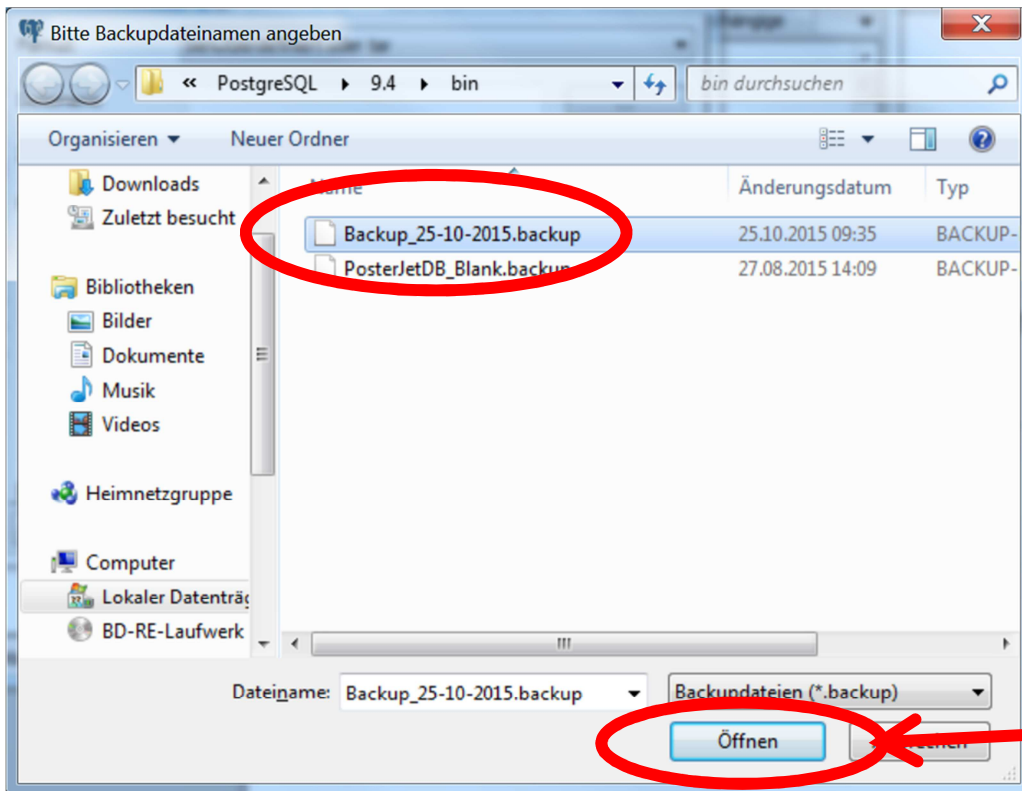

If you wish to restore a PosterJet database, whether completely empty or from an existing backup file, proceed as follows: open the application „pgAdmin III“. Enter the password to open the PosterJet database. Right click the entry „PosterJetDB“ and select the option „Restore“ from the context menu.

Click the button with the 3 dots in order to select a backup file. Click the “Restore”-button to restore the database from the selected backup file.

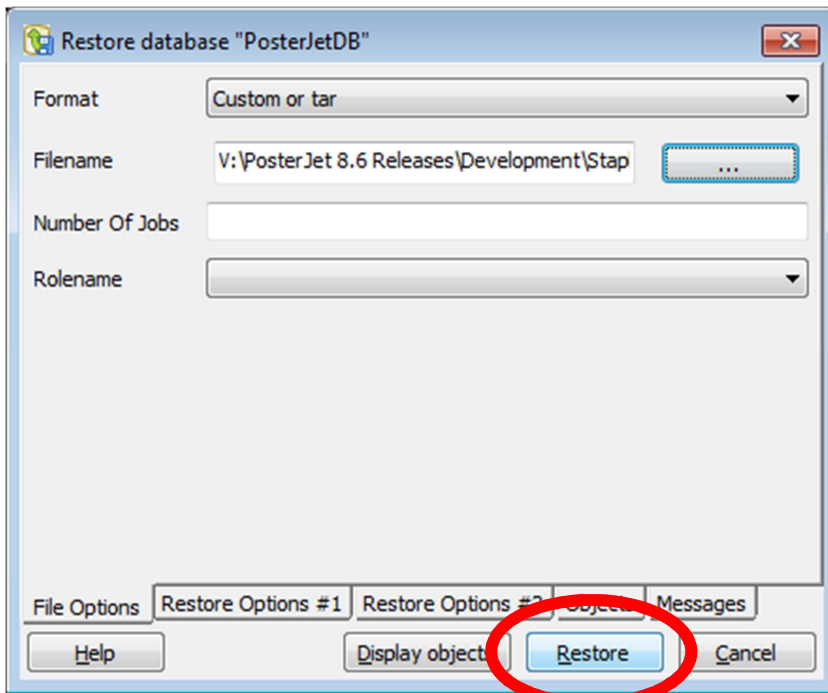

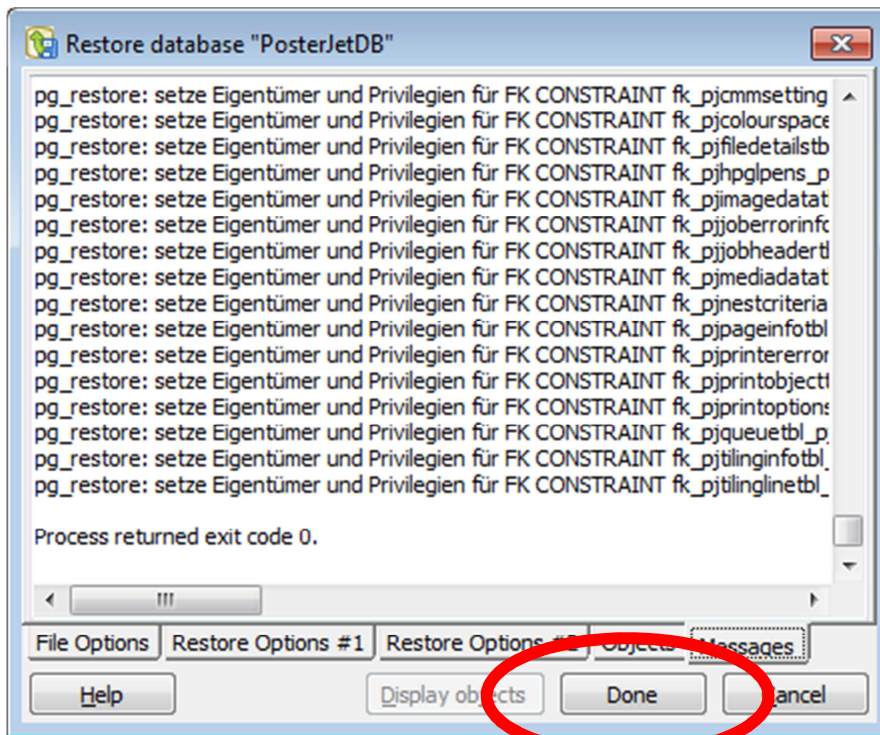

Open

**HINT:** select the file „PosterJetDB\_Blank.backup“ from the list in order to create a new and empty database (same status as after the very first installation of PosterJet).

Once you have selected a file click the “Restore“-button.

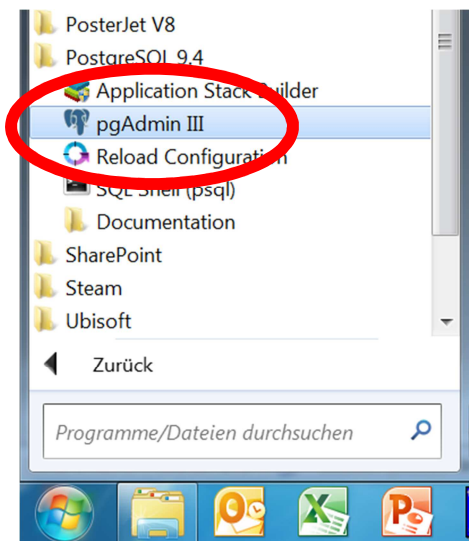

The database restore is successful if the message „process terminated with Exitcode 0“ appears. Complete the restore by clicking the „Ready“-button and close the application „pgAdmin III“.

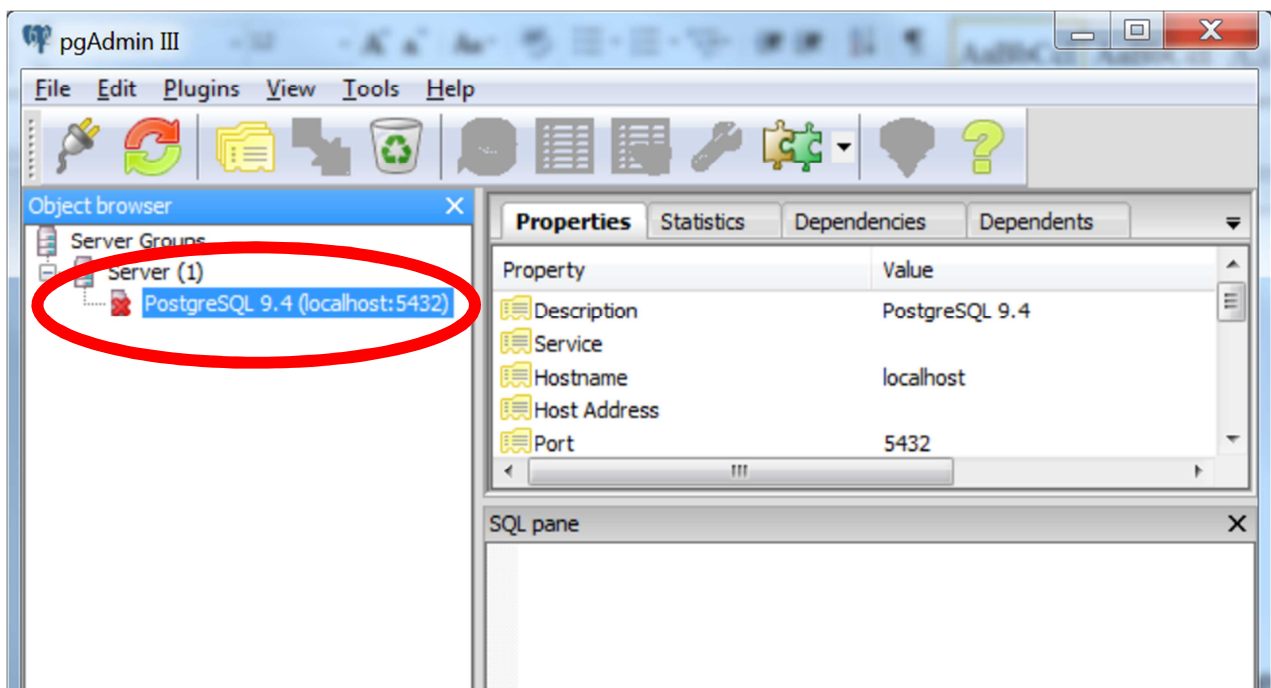

## Method 3: removing an existing database and create a complete new configuration

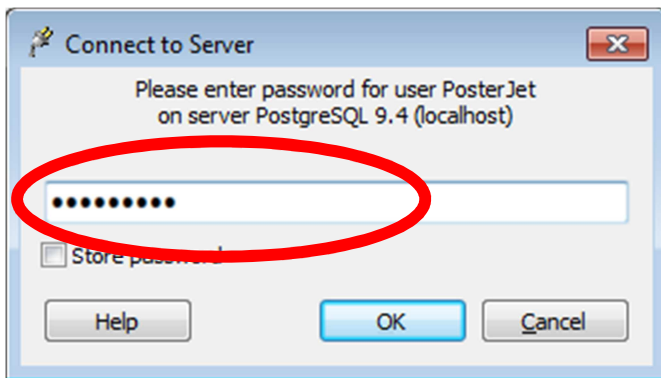

If the PosterJet Server can't be started it is highly probable that the database file was corrupted during operation and needs to be replaced. In some cases, restoring an existing database file with a backup or empty file will fail, because the current database needs to be removed first. Please proceed as follows to remove the current database so that you can either restore a backup file or the blank database file included in the PosterJet installation.

Please open the application „pgAdmin III“ under the Windows Start menu entry „PostgreSQL 9.4“.

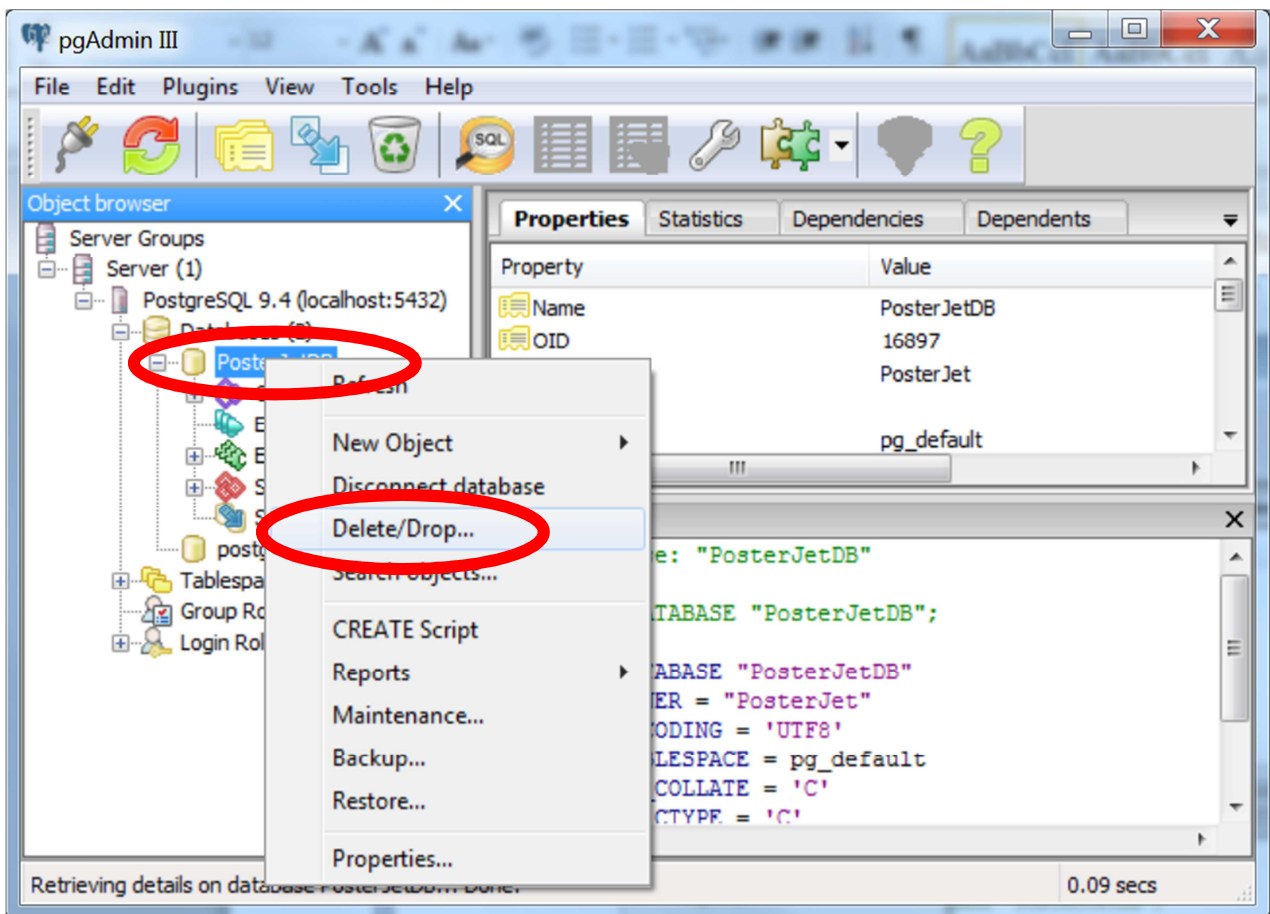

Open the PosterJet database by double clicking the entry „PostgreSQL 9.4 (localhost:5432)“ in the window „pgAdmin III“.

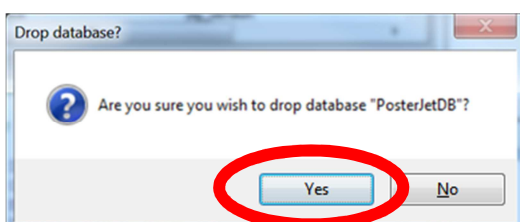

Enter the password and continue by clicking the “OK” button. The password for the PosterJet database is:  
**PosterJet** (case sensitive).

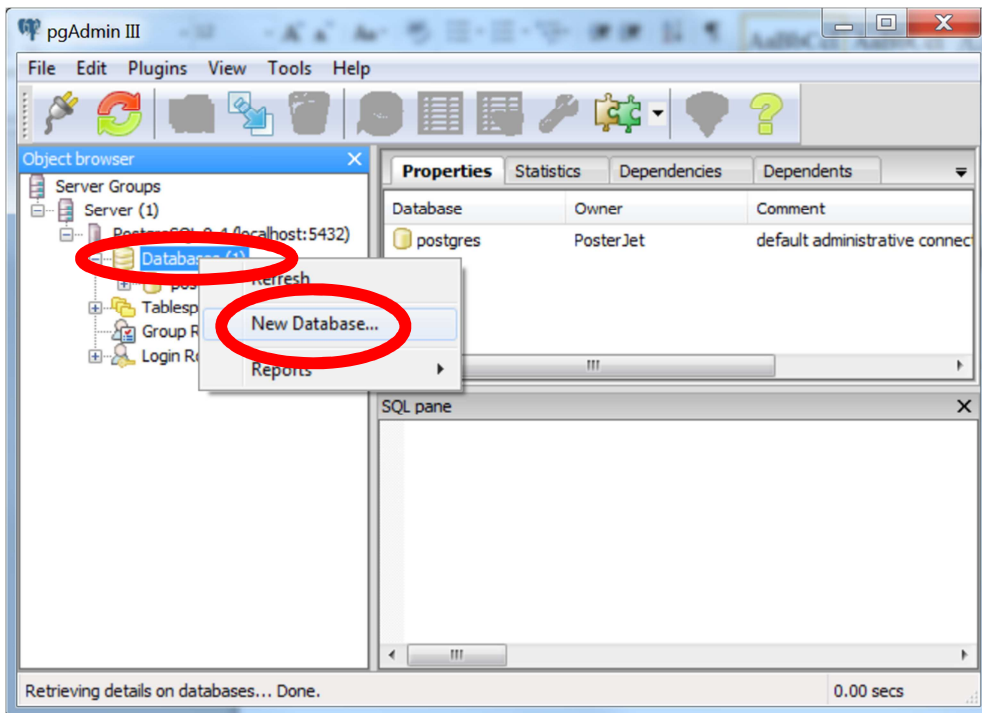

Click „OK“ once you have entered the password. Start the database backup by right clicking the entry „PosterJetDB“ and select the option „Delete/Drop...“ from the context menu.

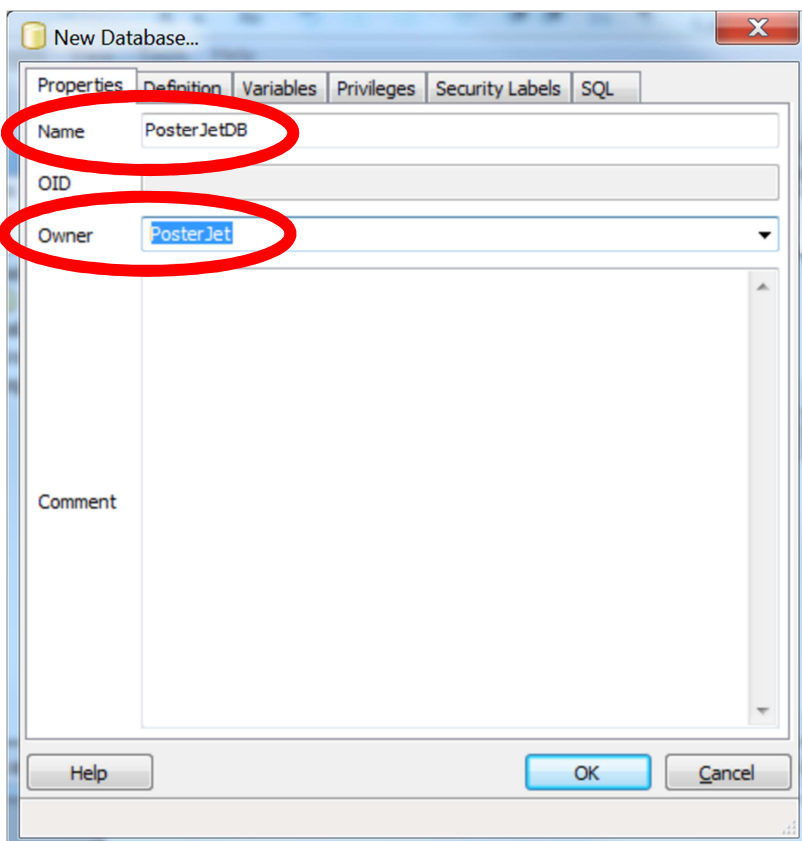

Confirm that you wish to delete the database file by clicking “Yes”.

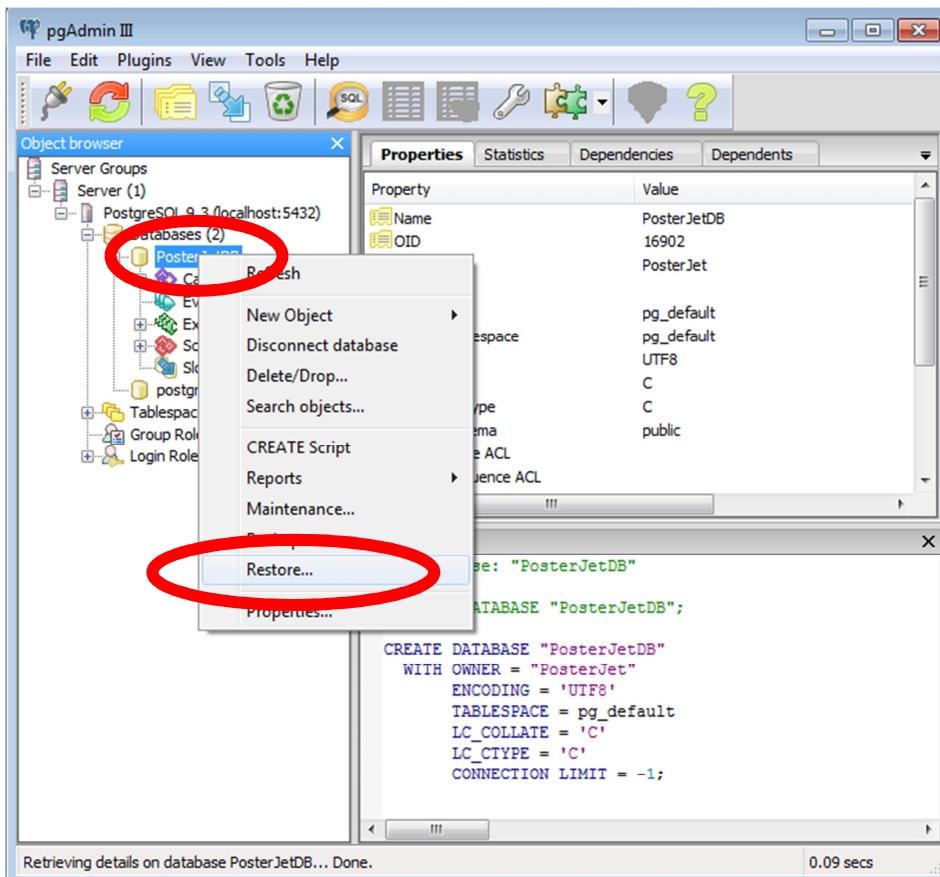

Create a new PosterJet database by selecting the option “Databases (1)” from the pgAdmin III Object browser window using the right mouse. Now select the option “New Database...” from context menu.

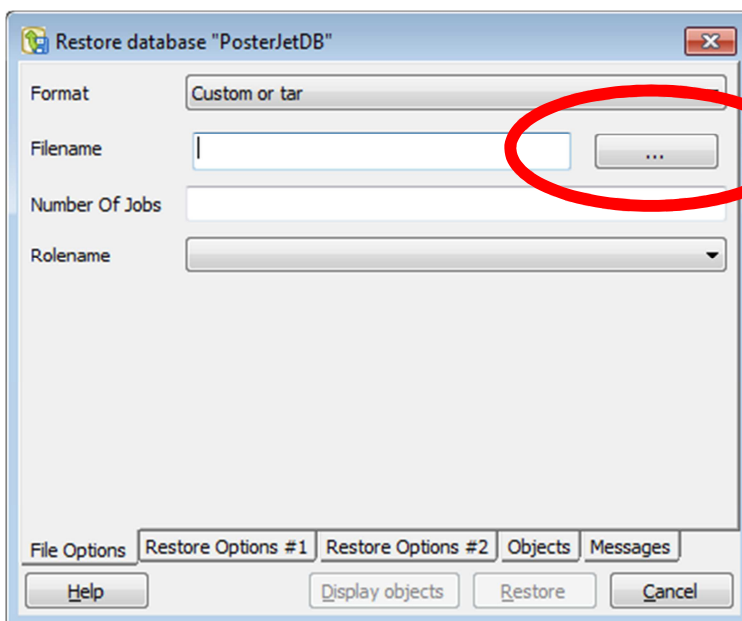

Enter “PosterJetDB” as the name for the new database and select “PosterJet” from the drop down menu under Owner. The confirm with a click on the “OK”-button.

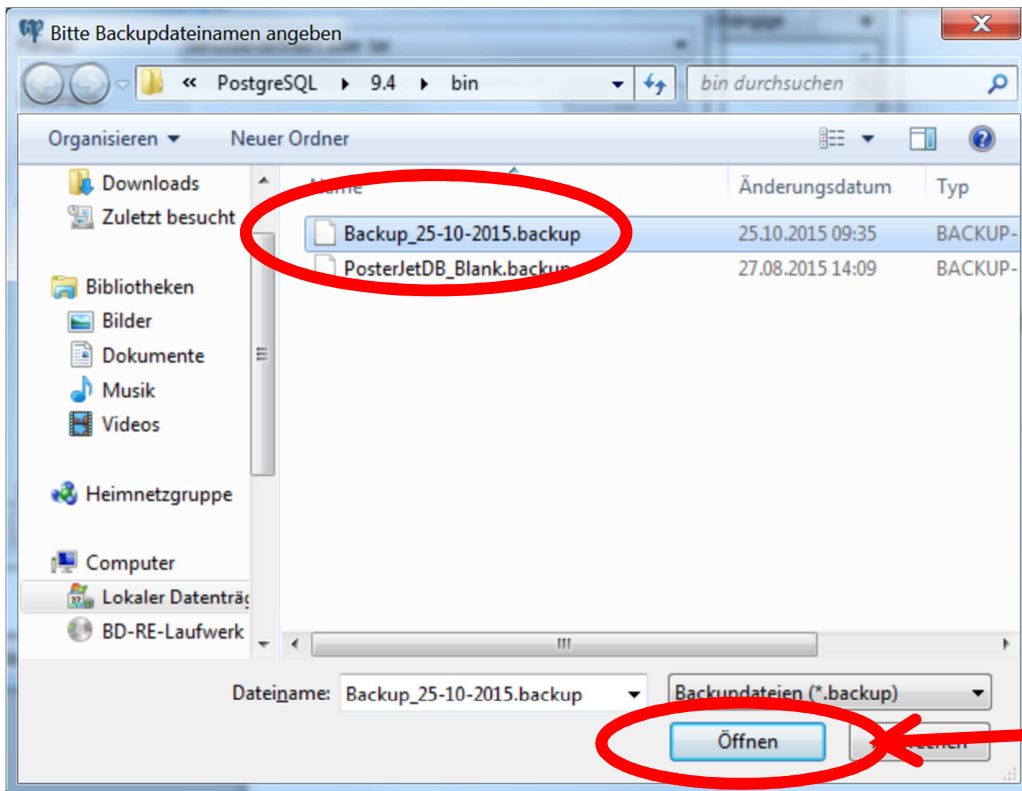

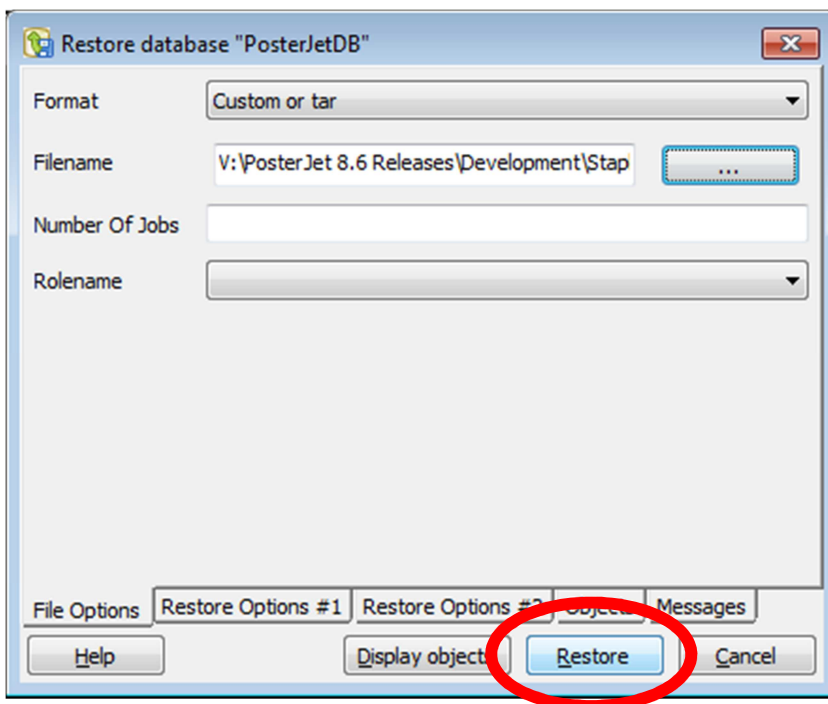

Click the button with the 3 dots in order to select a backup file. Click the “Restore”-button to restore the database from the selected backup file.

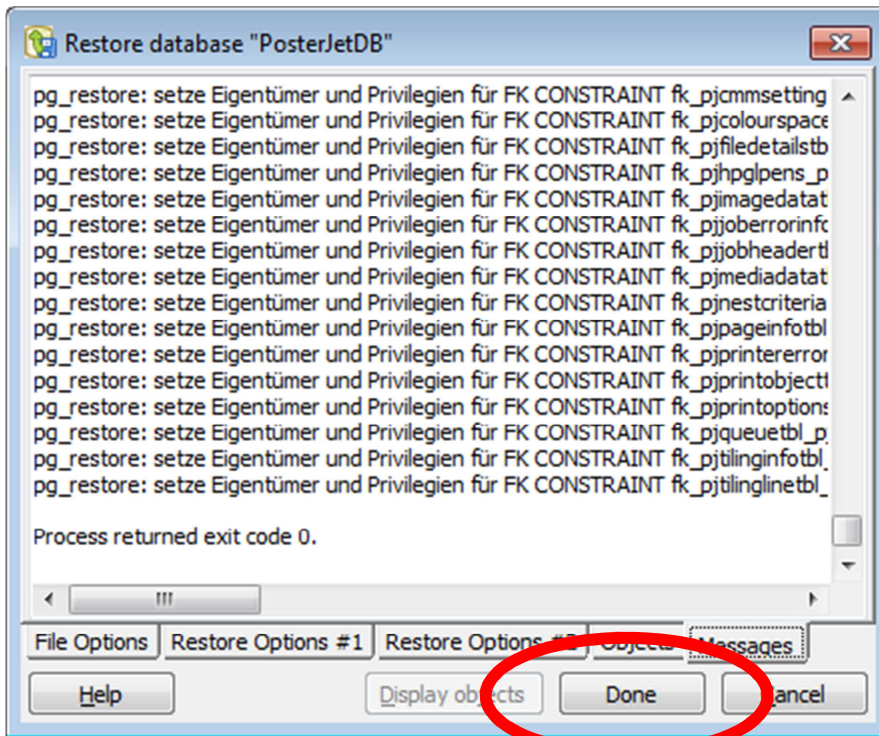

Either chose an existing file in order to restore a previous setup or chose the file “PosterJetDB\_Blank.backup” to restore a new and completely empty database. Click the “Open”-button once you have selected the appropriate file.

Once you have selected a file click the “Restore“-button.

The database restore is successful if the message „process terminated with Exitcode 0“ appears.

Complete the restore process by clicking the button „Done“ and close the application „pgAdmin III“. Restart PosterJet Server and Client.

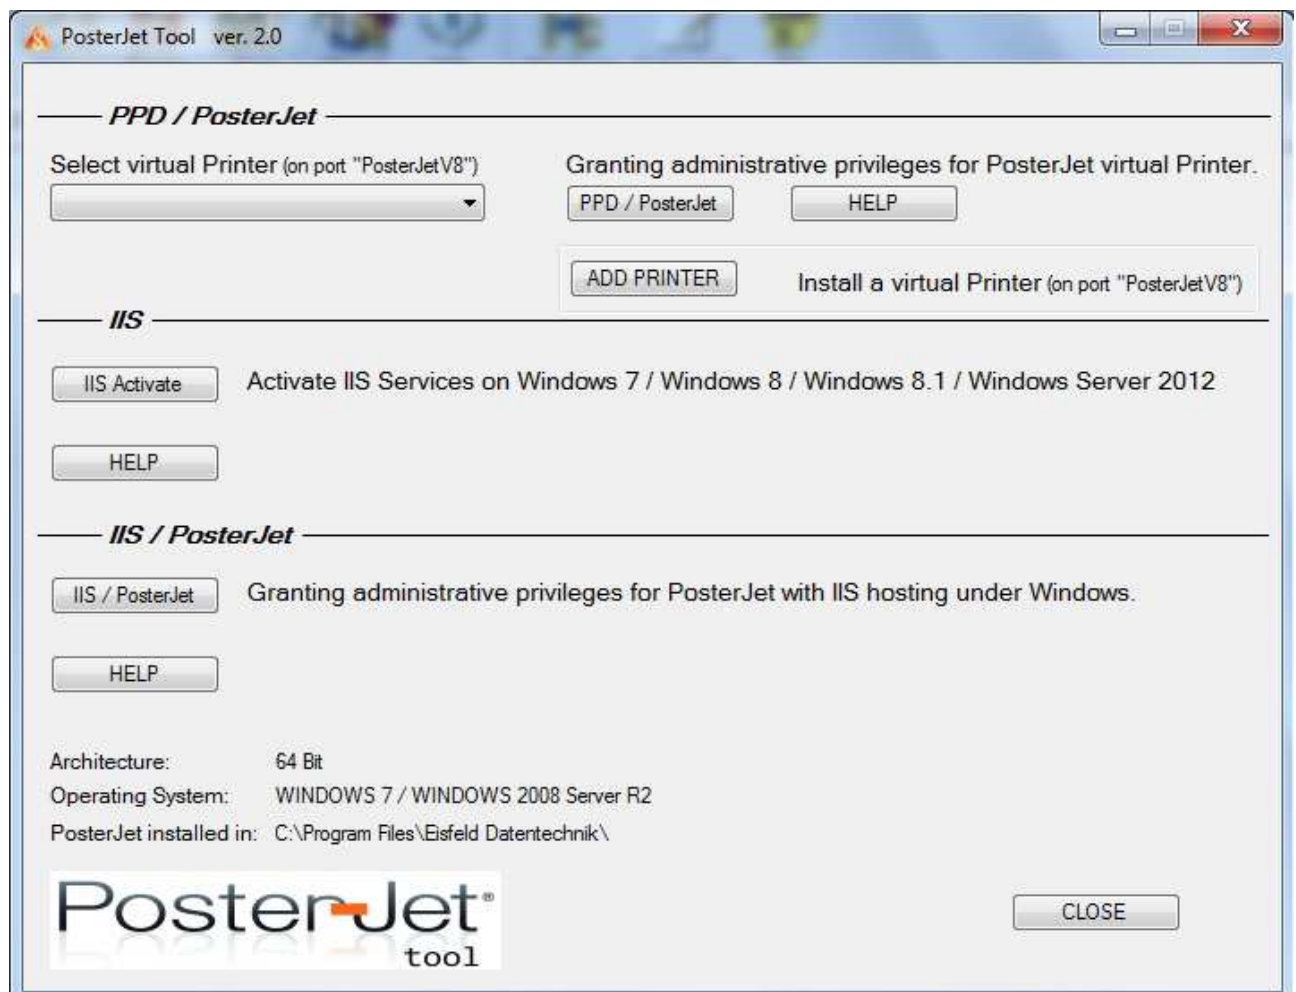

## The PosterJet Tool Ver2

This tutorial explains the functionality of the new “PosterJet Tool Ver2” (henceforth called “PJ Tool”) and how to use it correctly. We developed the tool to facilitate certain processes, which may become necessary after the installation of PosterJet.

The newest version of the PJ Tool can always be found on our website [www.posterjet.de](http://www.posterjet.de).

The PJ Tool consists of only one window, which is separated into three areas:

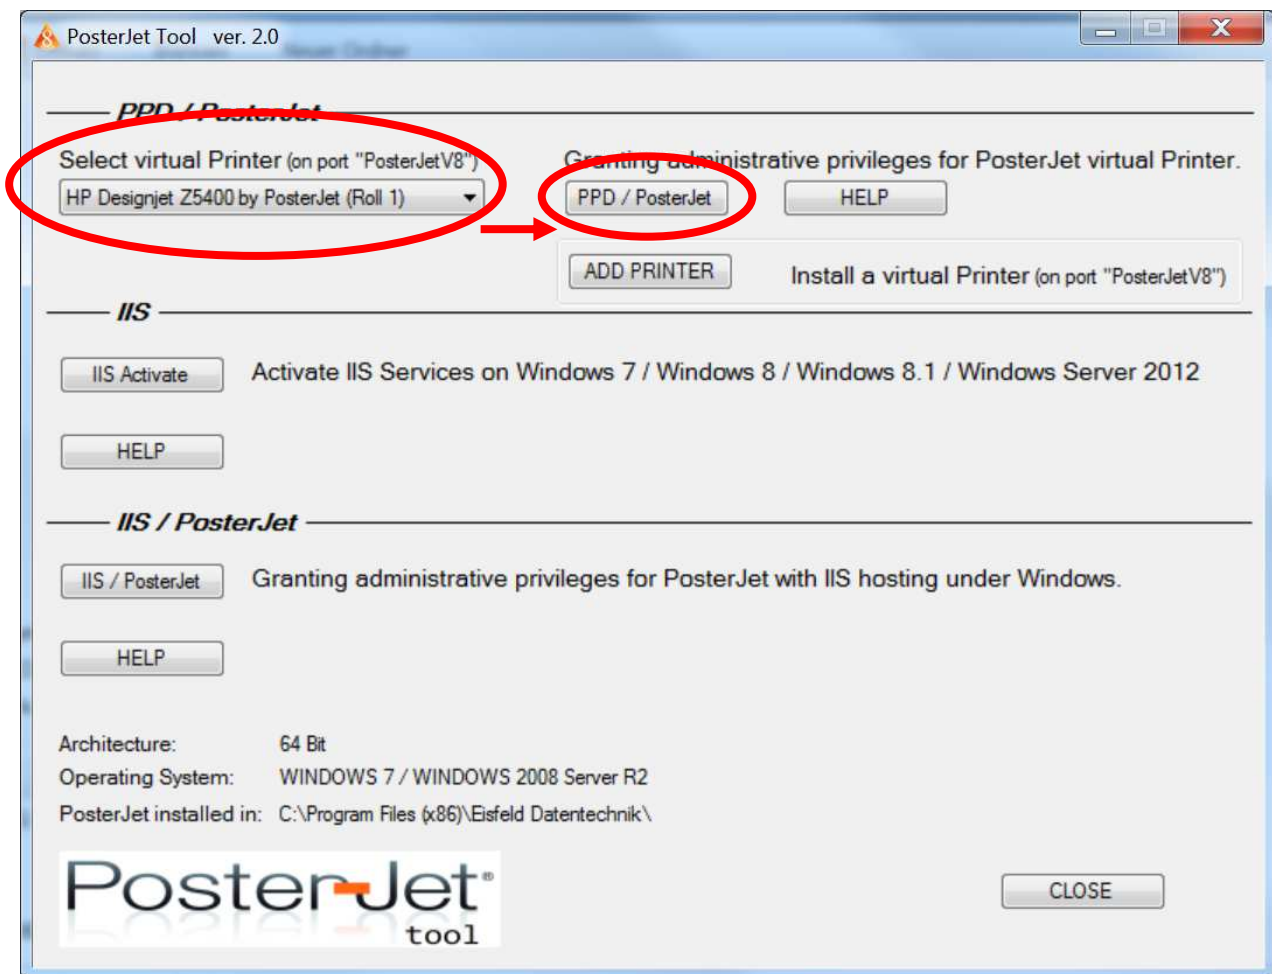

1. The top part helps you to grant administrative privileges (permissions) to the installed virtual PosterJet printer(s).
2. The middle helps you to install an IIS (Internet Information Service) on your computer (recommended for PosterJet installations under Windows Server OS).
3. At last the bottom part of the interface will automatically set configuration parameters for PosterJet to any installed IIS.

## Granting permissions to virtual PosterJet printer

At least one virtual PosterJet printer must be installed under Windows before you can set the permissions (see chapter explaining installation of a virtual printer or also called PPD). Necessary permissions must be set in order to guarantee the trouble-free operation since PosterJet virtual printer (PPD) come without digital signature. First close PosterJet Server and Client. Select the PosterJet virtual printer from the drop down menu and click the button "PPD / PosterJet" to set the necessary permissions. Wait until procedure is completed and reboot the PC.

Hint: Under Windows 8 and Windows 10 the installation of unsigned printer drivers is blocked by the operating system. Please check the Microsoft Support website for help on how to install unsigned drivers und Windows.

## Setup Windows Internet Information Services (IIS)

If you wish to run PosterJet with help of the Microsoft Internet Information Service instead of the normal PosterJet Hosting Service, you first will have to install the IIS on your system.

Attention: On server systems, for example like Windows Server 2012 R2, you will have to add specific “roles” to the server in order to add the IIS. To do so, please use the Server Manager or get in touch with your network administrator.

To install the IIS on a Windows 7 or Windows 8 system please follow these steps:

1. Exit all PosterJet applications (Admin Tool and Client) on your computer.
2. Start the PosterJet Tool Ver2 as administrator (right click → “run as administrator”).
3. Choose the option “IIS Activate” from the “IIS” section of the window. The tool will now install the IIS and its required components on your system. This may take a few minutes. Please restart your computer as required once the procedure is terminated.

The IIS is now installed on your computer, but not yet connected with PosterJet. To do this, please proceed with the next step as described under “Register PosterJet under IIS and grant permissions”.

## Register PosterJet under IIS and grant permissions

In order to register PosterJet under the IIS, a few parameters have to be set under Windows. It is also very important that PosterJet is granted the necessary permissions to function properly under the IIS. The PJ Tool will set these parameters for you. Please note that other applications using the IIS stay untouched. Only the newly added “PosterJet application pool” will be altered.

To start the process, please proceed as follows:

1. Close PosterJet Server and Client.
2. Start the PosterJet Tool Ver2 as administrator (right click → “run as administrator”).
3. Click the button “IIS / PosterJet” in the “IIS / PosterJet” section. The tool will now register PosterJet under the IIS and set all necessary permissions automatically. The procedure may take a few minutes. Please restart your computer again as required once the procedure is terminated.

After rebooting the PC, open the PosterJet Administration Utilities and switch the option under Hosted on “PosterJet V8 Hosting” to “Internet Information Services (IIS)” while the PosterJet server has been stopped. Save the changes by selecting the option “Save Settings” from the menu “Server”. PosterJet is now hosted as a service under the IIS, which enables the use of the PosterJet Server without being logged-in to your PC. Finally, remove the application “PosterJet Admin Tool” from the Windows Autostart menu, as it is no longer required.
